WEIRWOOD

FILE NO. WW/MOSAIC/2026

SUBJECT

MOSAIC

Investigation and intelligence platform for India's police, investigation, intelligence and disaster-management agencies.

ISSUED BY	Weirwood
PURPOSE	Product brochure
EDITION	2026

WEIRWOOD · INDIA
MOSAIC
PRODUCT FILE · 2026

Read the flags in order; each one answers a question an agency will ask.

A note on this file

This file introduces Weirwood and Mosaic, our investigation and intelligence platform, to everyone who will decide on it, use it or hold it to account.

1. It explains who we are, what Mosaic is, why agencies need it, what we deliver to government, why agencies choose it, and then each capability in turn, with the product's own screens attached as enclosures.
2. **In brief.** The records an investigation needs sit in many systems, under many names, and are still joined by hand. Mosaic connects them into one picture, raises leads with their evidence and records every step, so investigations are faster, better founded and able to stand up in court and before oversight.
3. Every person, number, account, company and case in the enclosures is synthetic, created for demonstration.

Flag A

Who we are

Who is Weirwood, and why trust it with this work?

We help the people who protect India see the whole picture 04

A name and a mark with a purpose 05

An Indian company, built for India's institutions.

We help the people who protect India see the whole picture.

Weirwood is an Indian technology company. We build investigation and intelligence software for government, defence and police agencies, designed around India's laws, languages and institutions.

1. **Why we exist.** Every serious investigation depends on information that sits in many places: police records, bank statements, call records, travel bookings, company registers and the evidence officers collect in the field. Weirwood exists to bring that information together, so officers spend their time on judgement rather than on assembling files.
2. **How we build.** To the standard public institutions must meet: every action tied to a lawful purpose, every decision recorded, every fact traceable to its source.

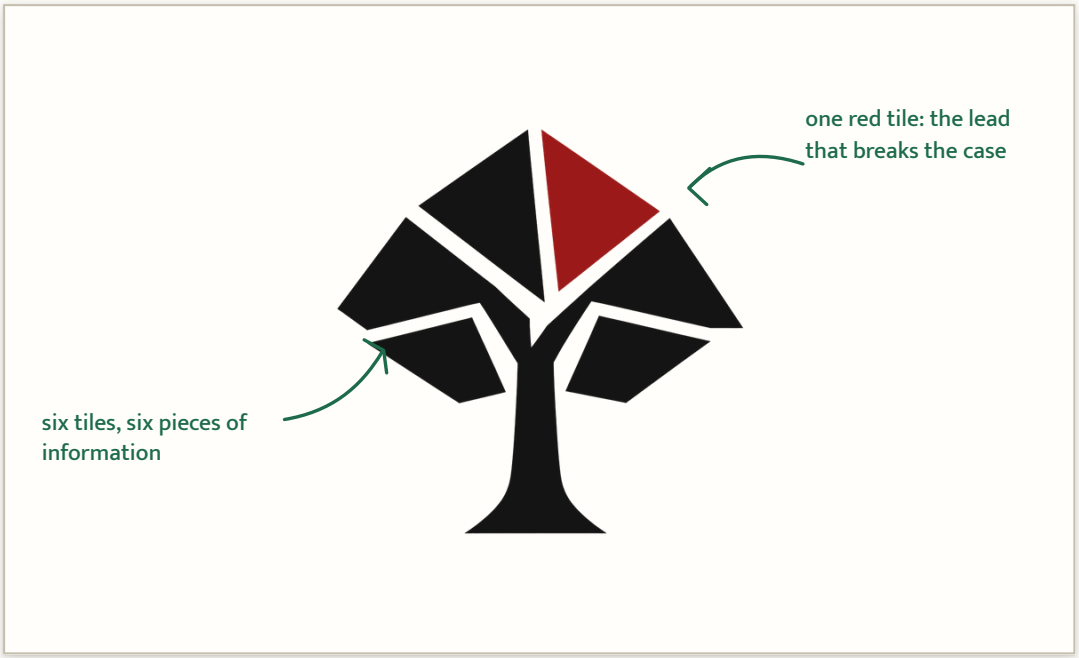

Particulars of the company.

Company particulars

NAME	Weirwood
NATURE	Indian technology company
PRODUCT	Mosaic, an investigation and intelligence platform
SERVES	Police, investigation, intelligence and disaster-management agencies
MISSION	Give every officer the full picture in minutes, with every step accountable.
COMMITMENT	Powerful tools, built with safeguards that earn public trust.
LICENCE	Open source, Apache 2.0

Every tile is a record; the picture is the case.

A name and a mark with a purpose.

1. **The name.** In a well-known story, a weirwood is an ancient tree through which one can see everything that happens across the land, past and present. It stands for what our software gives an investigator: sight across every record that matters.

2. **The mark.** A tree built from six tiles. Each tile is one piece of information; one tile is red, the piece of evidence that breaks a case open. The product is named Mosaic for the same reason: intelligence work has long followed the mosaic method, fitting small pieces together until the whole picture appears.

These four decide every design choice.

The principles we build by

3. **See the whole picture.** Bring every authorised source into one view, so nothing important is lost between departments.

4. **A person always decides.** The software proposes; officers decide. Every lead, match and approval is a human act, recorded.

5. **Safeguards come first.** Purpose, case scope, masking and audit are designed in from the first line of code.

6. **Built for India.** Indian scripts, Indian laws, Indian identifiers and Indian institutions, from the ground up.

Flag B

Introducing Mosaic

What is Mosaic, and what does it do?

One platform for every investigation 07

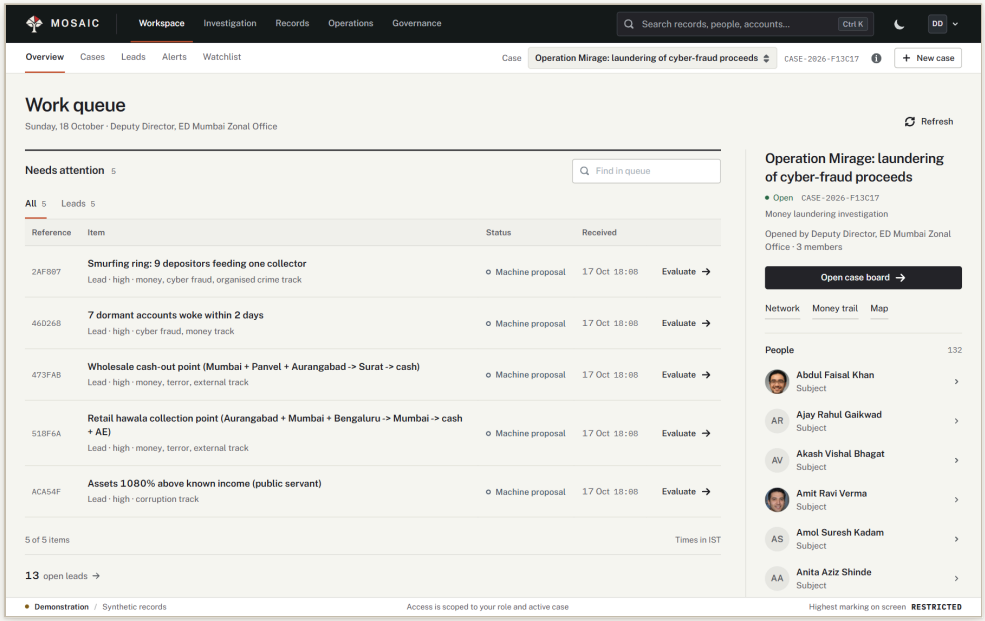

What Mosaic does 08

From one name or number to the whole case.

One platform for every investigation.

Mosaic connects an agency's authorised records into one picture of people, money, phones, places and events, and carries every finding from the first search to the court-ready report.

Encl. 1 The Mosaic workspace

SYNTHETIC RECORDS FOR DEMONSTRATION

This is where an officer's day begins. The work queue on the left lists everything that needs a decision, with its reference, status and the time it arrived. The active case stays on the right, with its legal basis, its people and a direct route to the case board, network, money trail and map.

Particulars of the platform.

Mosaic at a glance

Integrated modules	17
Types of records connected	23
Pattern detectors, written around Indian law	19
Money-laundering typologies	16
Scripts understood, eight Indian and English	9
Agency mission tracks	8

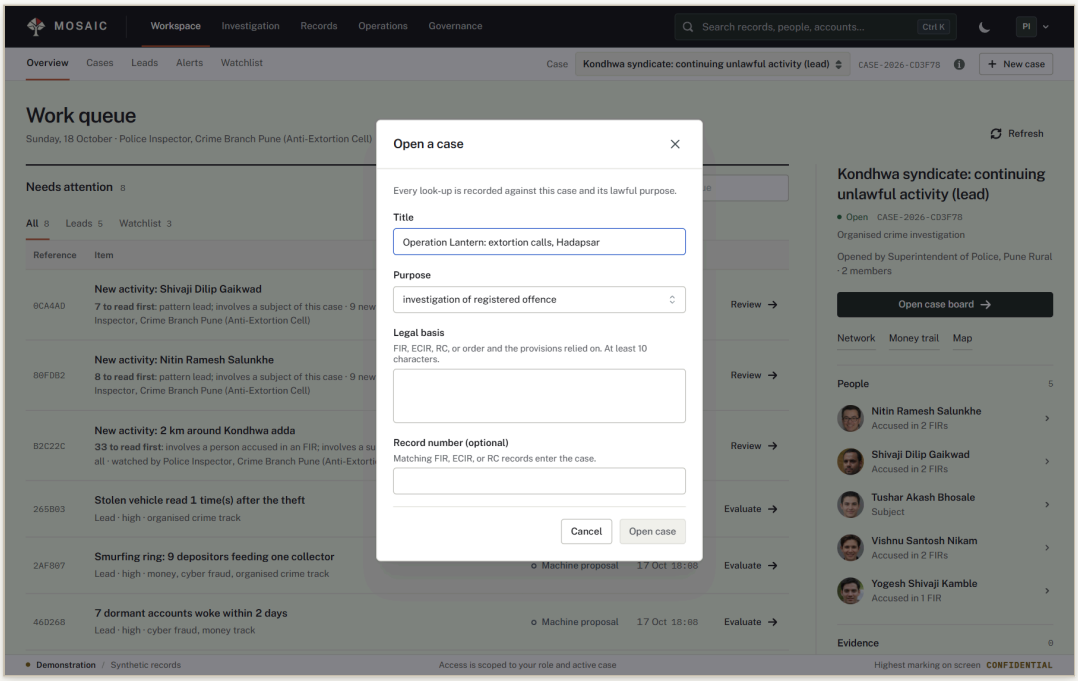

Six capabilities, one file.

What Mosaic does.

1. **Connect.** Brings in FIRs, bank statements, call records, travel, registries and seized documents, cleaned and approved before they enter.
2. **Resolve.** Recognises the same person across scripts, spellings and changed numbers, and shows the reasons.
3. **Investigate.** Dossiers, networks, money trails, maps and timelines: the case laid out the way investigators think.
4. **Detect.** Pattern detectors built on Indian law raise leads with their evidence, for the agency that owns the mission.
5. **Account.** Every look-up tied to a case and its lawful purpose, in a tamper-evident record.
6. **Deliver.** Sealed evidence, case diaries and court packs with a draft BSA s.63 certificate, in one step.

Every look-up is tied to a case and its purpose.

Encl. 2 Opening a case

Every investigation in Mosaic starts as a case with a title, a lawful purpose and a legal basis, such as an FIR, ECIR or court order. Every look-up made afterwards is recorded against this case and its purpose, which is what makes the work accountable later.

Flag C

Why you need Mosaic

Why does an agency need it now?

Why agencies need Mosaic 10

Before and after Mosaic 11

Every agency holds the records; nobody sees them together.

Why agencies need Mosaic.

Agencies hold more data than ever. Yet the records an investigation needs sit in different systems, in different formats, under different names, and joining them still happens by hand.

1. **Records in silos.** FIRs, bank replies, call records, toll reads and registries each arrive from a different office, in a different format.
2. **One person, many names.** The same suspect appears in Devanagari, Urdu and English, with initials and changed numbers.
3. **Patterns between sources.** Mule networks, burner phones and convoys appear only when money, calls and movement are seen together.
4. **Time works against you.** While files are assembled by hand, money moves abroad and suspects change numbers.
5. **Every step must stand up.** Courts and oversight bodies ask why each record was opened, by whom, and under which order.
6. **Conclusions without reasons.** Findings passed between officers lose the records and reasoning that support them.

Same person? Today an officer decides by eye, one file at a time.

Encl. 3 **One person, as six systems record the name. A synthetic example.**

FIR REGISTER	BANK KYC	CALL RECORDS
Nitin Ramesh Salunkhe Accused, PS Kondhwa	**N R SALUNKHE** Savings account ending 4471	**Nitin Salunke** Subscriber, prepaid SIM
RAIL RESERVATION	**COMPANY REGISTER**	**VEHICLE REGISTER**
SALUNKHE NITIN Pune to Patna, sleeper	**NITIN R SALUNKHE** Director of two companies	**Salunke N. R.** Owner of a two-wheeler

The same eight tasks, done in one place.

Before and after Mosaic.

What changes for an investigating team when every record, decision and piece of evidence lives in one platform.

TASK	AS IT STANDS	WITH MOSAIC
Gathering records	Letters to each department; spreadsheets assembled by hand	Authorised sources prepared once and shared by the whole case
Identifying people	Names compared by eye across scripts and spellings	Cross-script matching, with every doubtful case decided by a person
Finding connections	Links found by chance, if at all	Networks, paths and shared records shown with their evidence
Following money	Bank statements traced line by line	Funds traced hop by hop to their end points
Spotting patterns	Depends on an officer remembering a similar case	19 detectors and 16 typologies at work continuously
Handling evidence	Files copied between folders and drives	Sealed on arrival, with a fingerprint and custody history
Writing reports	Facts retyped; reports drift from the evidence	Facts inserted from the case, each with its source
Oversight	Access rarely recorded; reviews reconstruct events	Every look-up recorded in a tamper-evident trail

Flag D

What we deliver

What exactly does the agency receive?

A complete platform, delivered and supported 13

Built for every agency 14

Installed, configured, trained and supported.

A complete platform, delivered and supported.

Weirwood delivers Mosaic as a working capability for the agency, from installation and data onboarding to training, governance and continuing support.

1. **The Mosaic platform.** All seventeen modules: workspace, cases, leads, alerts, watchlist, explorer, network, dossier, money trail, connections, map, data studio, match review, face search, disaster map, oversight and administration.
2. **Deployment on your terms.** On a single offline laptop, in a district office or in a state data centre, on the agency's own infrastructure.
3. **Data onboarding.** The agency's sources mapped into Mosaic through the data studio, every intake reviewed and approved by its own officers.
4. **Governance set-up.** Roles, agencies, lawful purposes, approvals and oversight configured to the institution's rules.
5. **Training.** Hands-on training for investigating officers, supervisors, analysts, data stewards and oversight officers.
6. **Support and updates.** Continuing support, improvements and new detectors as crime patterns and laws evolve.

Every role, one application.

Every role, one application

7. **Investigating officers.** Search, follow leads, seal evidence and write the case diary.
8. **Supervisors.** Approve cases, publications and matches as the second officer.
9. **Analysts.** Work across networks, money trails and patterns.
10. **Oversight officers.** Review who saw what, and why, without seeing case data.

Each agency sees only its own mission.

Built for every agency.

One platform serves very different missions from the same foundation, with access separated by agency, role and case.

AGENCY	MISSION
State police and crime branches	Gangs, organised crime, arms, vehicle-theft rings and kidnapping, from FIR to charge-sheet
State cyber cells	Cyber fraud and mule-account networks, from complaint to cash-out
National Investigation Agency	Terror, terror financing and explosives, across states and borders
Narcotics Control Bureau	Narcotics, precursor diversion, couriers and convoy vehicles
Central Bureau of Investigation	Corruption, tender rigging and assets disproportionate to income
Enforcement Directorate	Money laundering, hawala routes and shell-company networks
Intelligence Bureau	Internal-security network mapping
Research and Analysis Wing	Cross-border handlers, money and travel
State disaster-management authorities	Alerts, affected districts, hospitals and relief dispatch

Flag E

Advantages

Why choose Mosaic over the way things are done today?

Why agencies choose Mosaic 16

Safeguards built into every step 17

Power and discipline in the same tool.

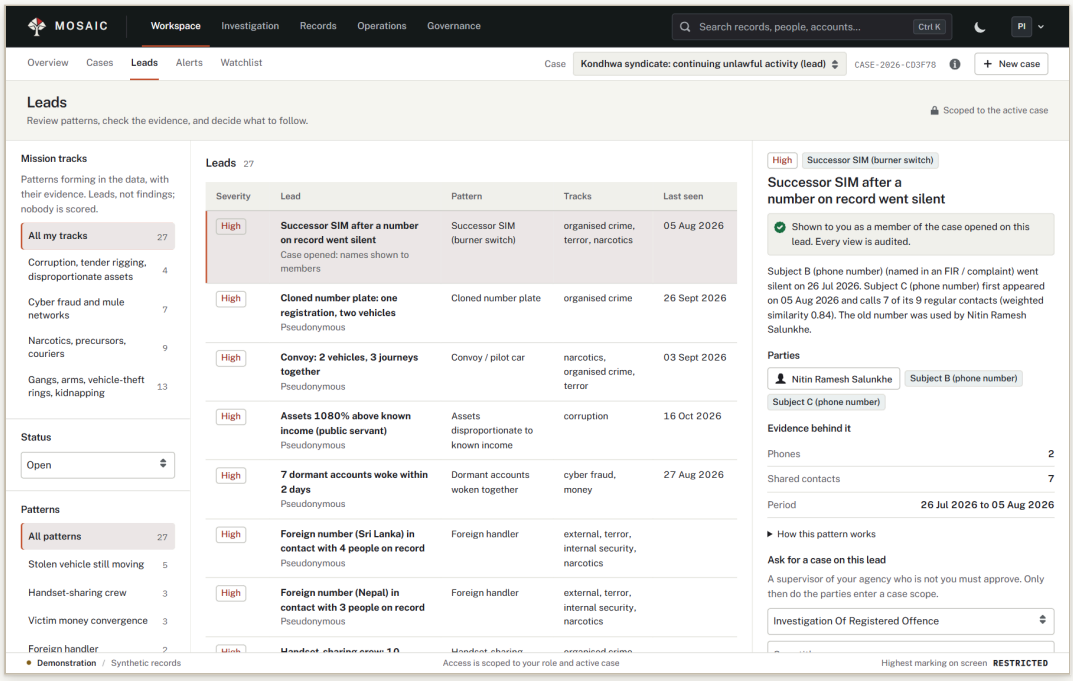

Why agencies choose Mosaic.

Mosaic combines the analytical power investigators need with the discipline public institutions require.

1. **Built for India.** Eight Indian scripts and English, Indian identifiers, official LGD codes, and detectors written around BNS, PMLA and NDPS.
2. **Safeguards built in.** Purpose-bound cases, two-officer approvals, masked identifiers and a tamper-evident audit trail.
3. **Evidence with every lead.** Every lead and match shows its evidence and its innocent explanations. No person is ever scored.
4. **Court-ready by design.** Sealed exhibits, custody chains and a draft BSA s.63 certificate, produced in one step.
5. **Runs anywhere.** Fully offline on a laptop in the field, or at state scale in a government data centre.
6. **Open and auditable.** Open source under Apache 2.0, so agencies, auditors and courts can examine exactly how it works.

A lead is a question for an officer to answer.

Encl. 4 Leads with their evidence

Leads across every mission track, each with its pattern, severity and tracks. People stay pseudonymous, and the panel on the right shows the evidence behind the selected lead: phones, shared contacts and the period it covers.

Every decision has a name and a reason.

Safeguards built into every step.

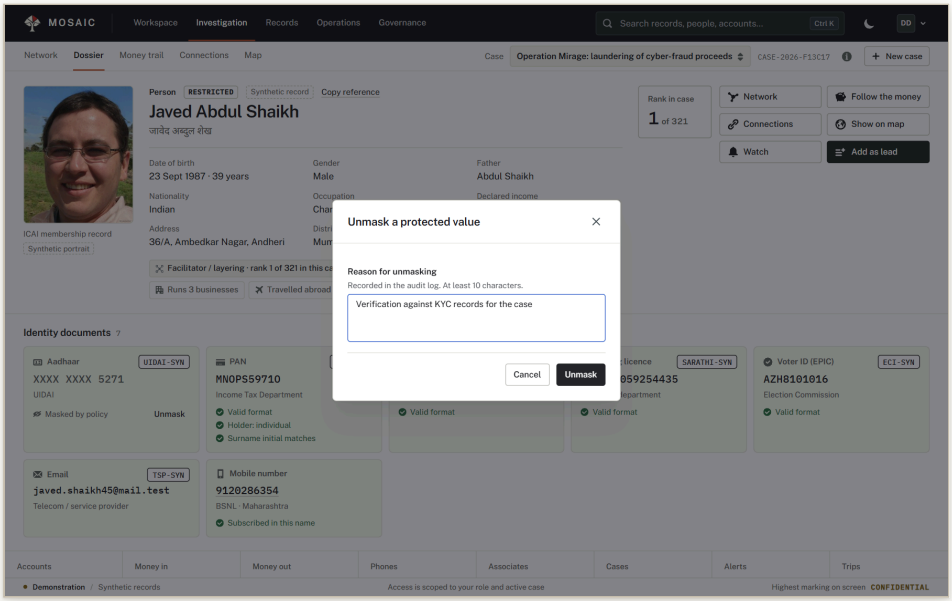

Mosaic is designed so that the most powerful investigative tools are also the most accountable.

1. **Purpose-bound access.** Every case states its lawful purpose; the purpose decides which records its officers may read.
2. **Two-officer approval.** Opening cases from leads, publishing data and confirming face matches always need a second officer.
3. **Masked by default.** Aadhaar is never stored in full. Seeing a protected value needs a written, recorded reason.
4. **Tamper-evident audit.** Every view, search and action enters a hash-chained log that cannot be edited.
5. **Insider-threat alarms.** Bulk look-ups and planted canary records alert an independent oversight officer.
6. **Retention and legal hold.** Closing a case sets when its data must be let go; a legal hold stops the clock.
7. **Red lines.** Mosaic has no purpose for watching journalists, activists, protesters, political opponents or religious groups, and refuses to open such a case.

RED LINES
WILL NOT BE CROSSED

Unmasking needs a written reason.

Encl. 5 Unmasking a protected value

Seeing a masked value, such as a full Aadhaar number, needs a written reason. The reason is recorded in the audit log and visible to oversight.

Flag F

Capabilities

What does Mosaic do, screen by screen?

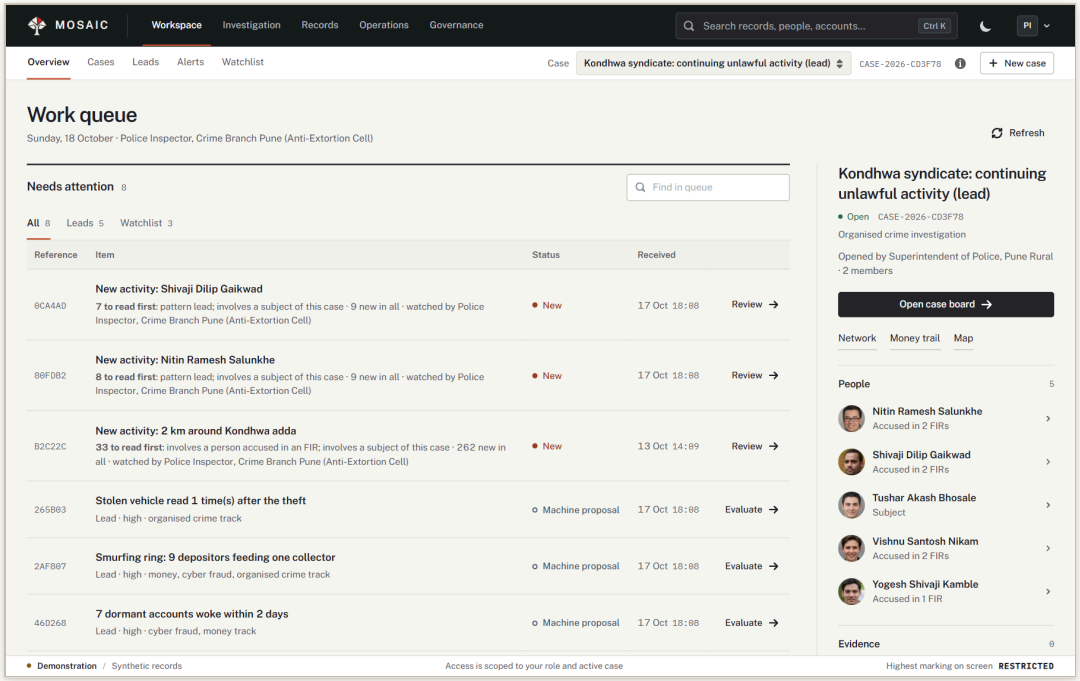

Encl. 6	Workspace and search	19
Encl. 9	Cases and leads board	21
Encl. 12	Entity dossiers	23
Encl. 15	Network analysis	25
Encl. 18	Money trail and connections	27
Encl. 21	Map and area search	29
Encl. 24	Pattern leads and alerts	31
Encl. 27	Watchlist and explorer	33
Encl. 30	Data studio and record matching	35
Encl. 33	Evidence and court-ready reports	37
Encl. 37	Face search	40
Encl. 40	Disaster operations	42
Encl. 43	Oversight and administration	44

Fewest steps for the officer in the field.

Workspace and search

Every day starts in one place: the officer's work queue, inside the active case, with search one keystroke away.

Encl. 6 The work queue

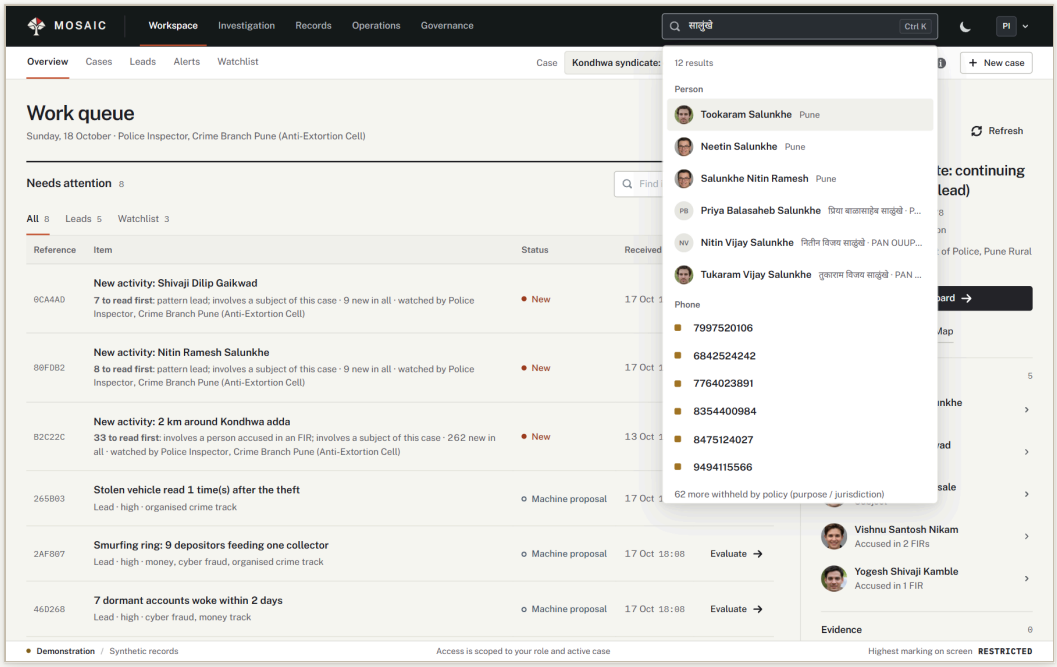

The work queue of a Police Inspector in a Crime Branch anti-extortion cell. New activity on watched people, leads proposed by the pattern engine and items awaiting review are listed in one place, each saying what happened, who it concerns and when. The active case, its people and its evidence sit alongside.

1. **The case comes first.** The active case, its purpose and legal basis are always on screen.
2. **One work queue.** Leads, watched activity, requests and approvals in one prioritised list.
3. **Search in any script.** Ctrl + K finds any name, phone, PAN, account, vehicle or case number.
4. **Access by role.** Each officer sees only the screens and records their role allows.

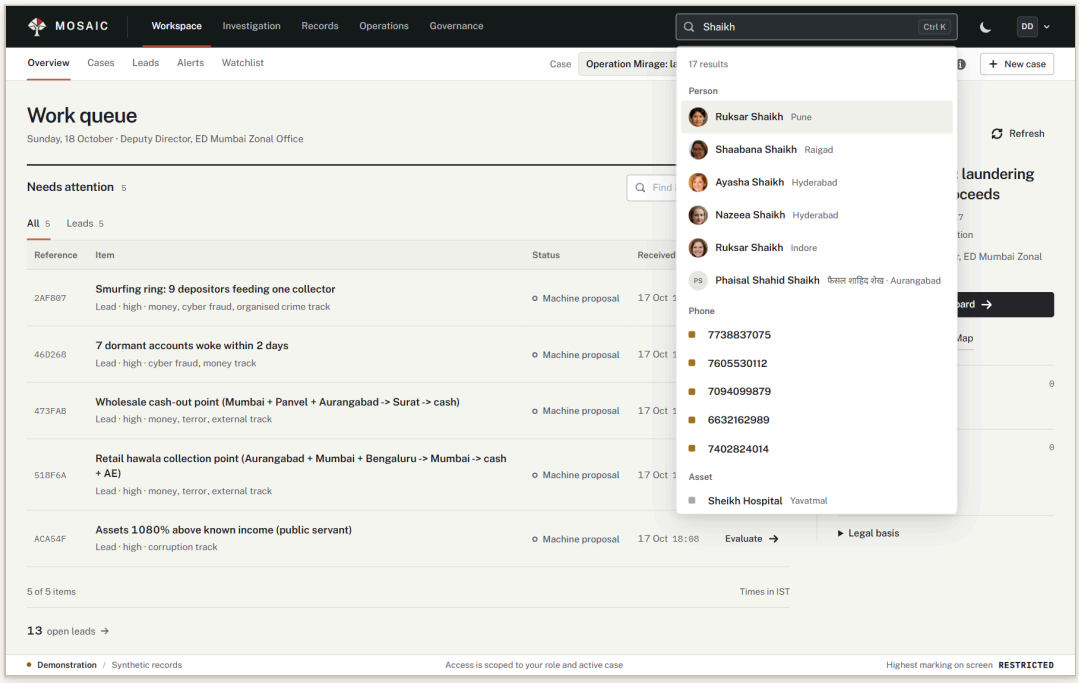

Workspace and search contd.

Encl. 7 Search in any script

A name typed in Devanagari finds the same people recorded in English, with every spelling the records hold. Phones, accounts and assets that match appear in the same list, so one search covers every kind of record.

Encl. 8 Search by name

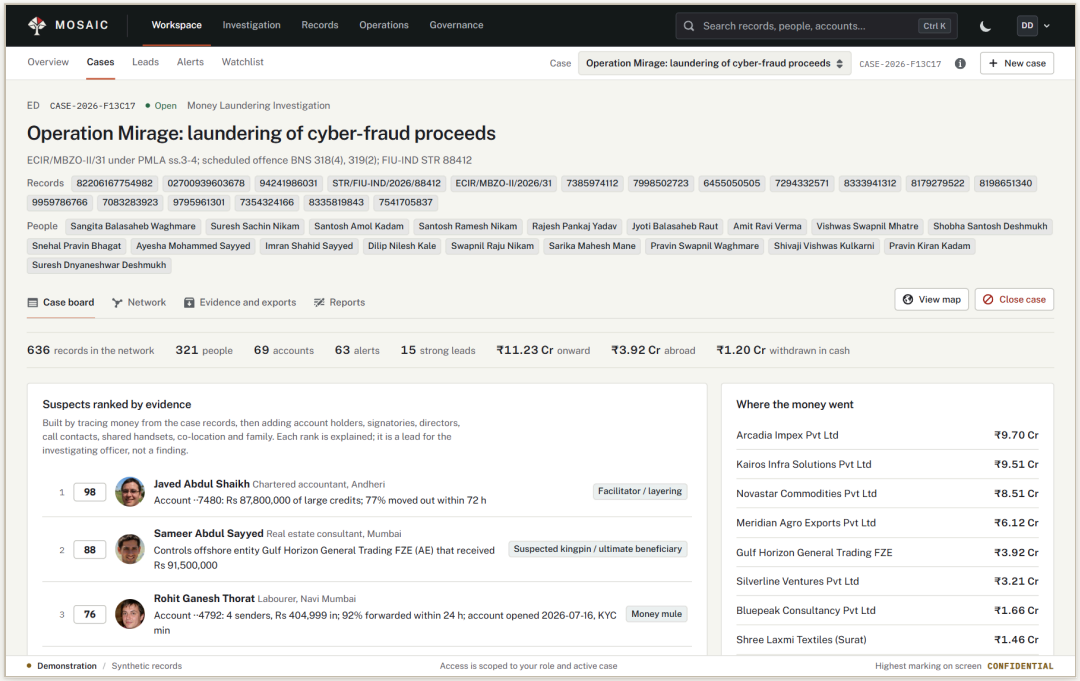

Searching a surname returns 17 results grouped as people, phones and assets, each with its place. Choosing a result opens it inside the active case; records outside the officer's access never appear.

No step rests on one officer's word.

Cases and leads board

A case board that builds itself from the case records, ranks suspects by evidence and tracks every lead to a decision.

Encl. 9 The case board

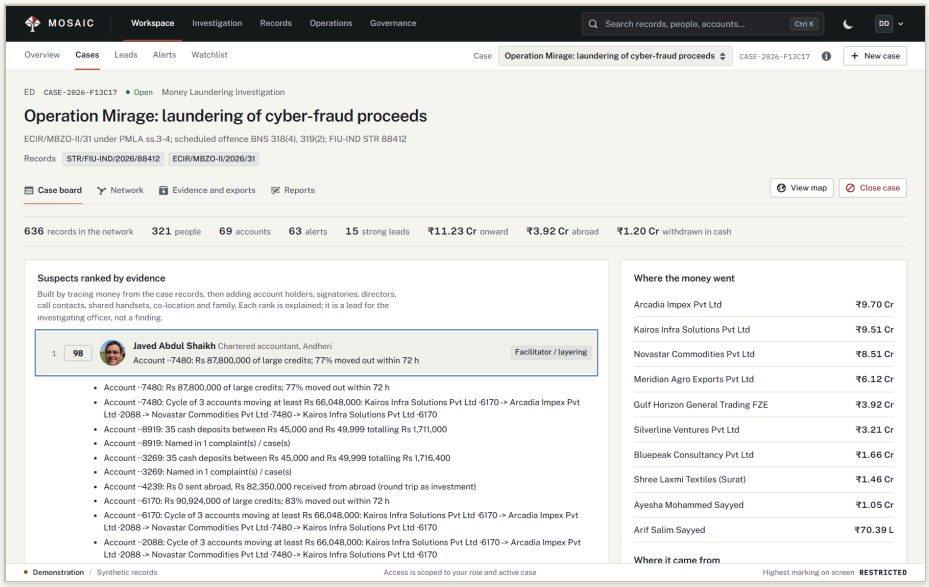

The case board opens on the case's legal basis and its key figures: records in the network, people, accounts, alerts and the money traced onward, abroad and withdrawn in cash. Below, suspects are ranked by the evidence that ties them to the money, and the destinations of the funds are listed with their amounts.

1. **Suspects ranked by evidence.** Money, calls, directorships and shared handsets, every rank explained.
2. **Where the money went.** Destinations, sources and the amounts sent abroad or withdrawn in cash.
3. **Leads to decisions.** A lead moves to Action authorised only with a supervisor's approval.
4. **Close with a clear trail.** Outcome, retention and legal hold are all recorded.

ACTION AUTHORISED
SUPERVISOR

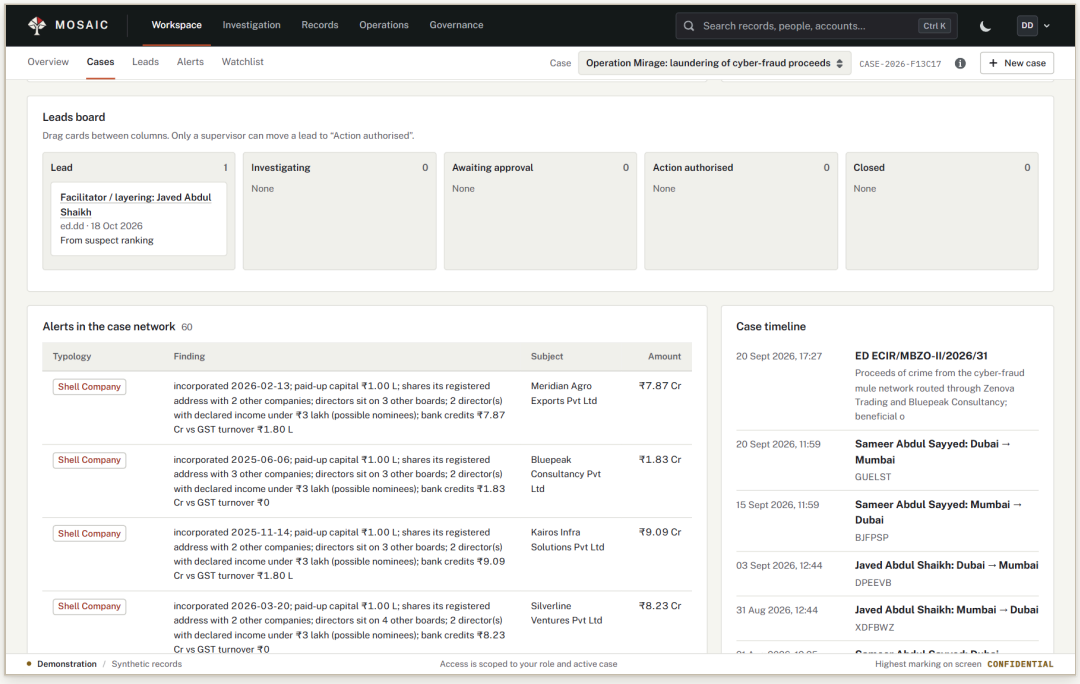

Cases and leads board contd.

Encl. 10 Why a suspect ranks where they do

Opening a suspect lists the facts behind the rank: each account, each cycle of transfers and each cash deposit, with amounts and dates. Every line comes from the records, and the rank is a lead for the investigating officer to test, not a finding.

Encl. 11 The leads board

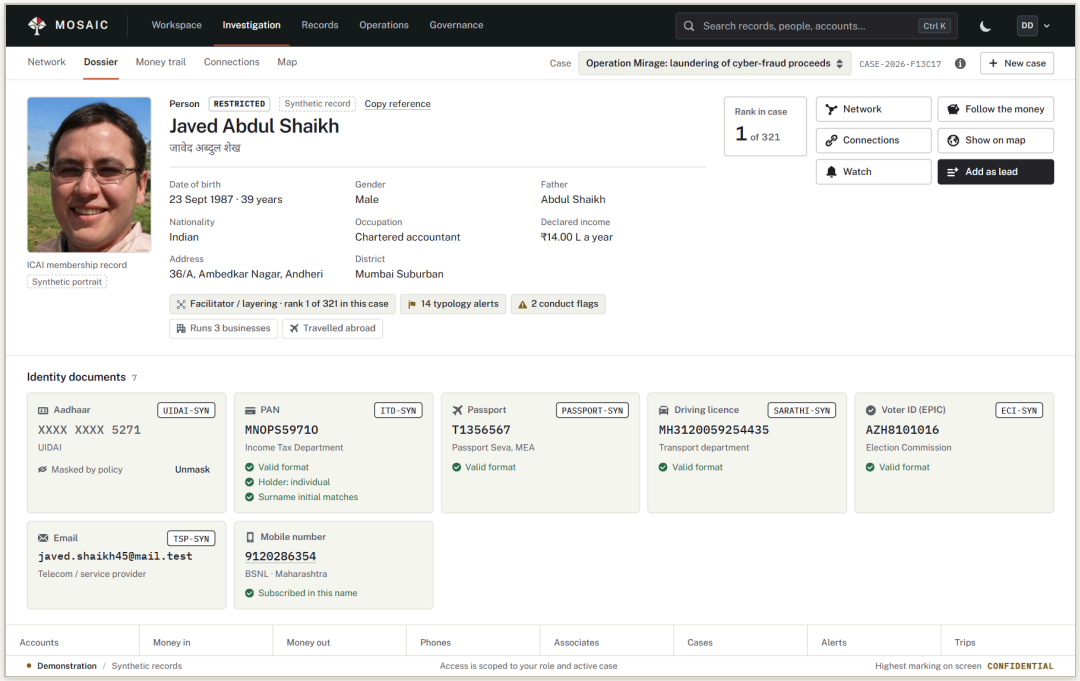

Every lead moves across the board from proposal to investigating, awaiting approval, action authorised and closed. Only a supervisor can move a lead to Action authorised. The alerts raised in the case network and the case timeline sit below, so evidence and sequence stay together.

The whole person, with every source.

Entity dossiers

Everything the case may know about one person, on one page, with the source of every fact.

Encl. 12 The dossier

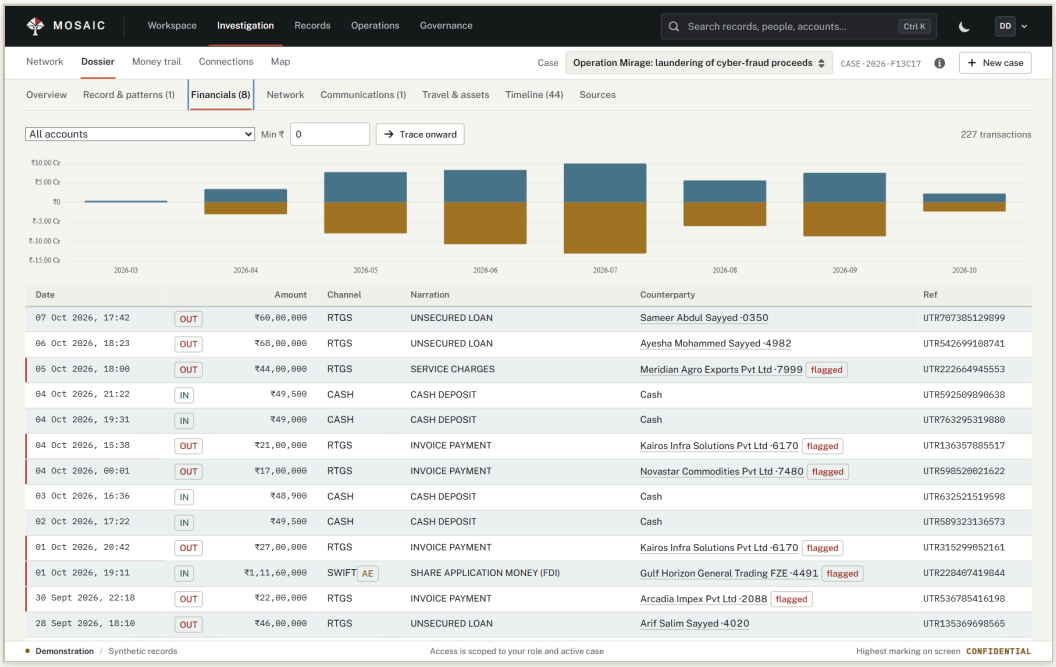

Everything the case may know about one person: name in English and in the original script, date of birth, address, rank in the case and identity documents. Aadhaar stays masked; each document shows whether its format is valid. From here the officer can follow the money, open the network or start a watch.

1. **Identity at a glance.** Name in English and in its original script, documents, address and role in the case.
2. **Protected by default.** Aadhaar masked; unmasking needs a recorded reason.
3. **Money, calls and travel.** Accounts, transactions, top contacts, trips and assets in dedicated tabs.
4. **Every fact sourced.** The system, record and arrival time behind every value.

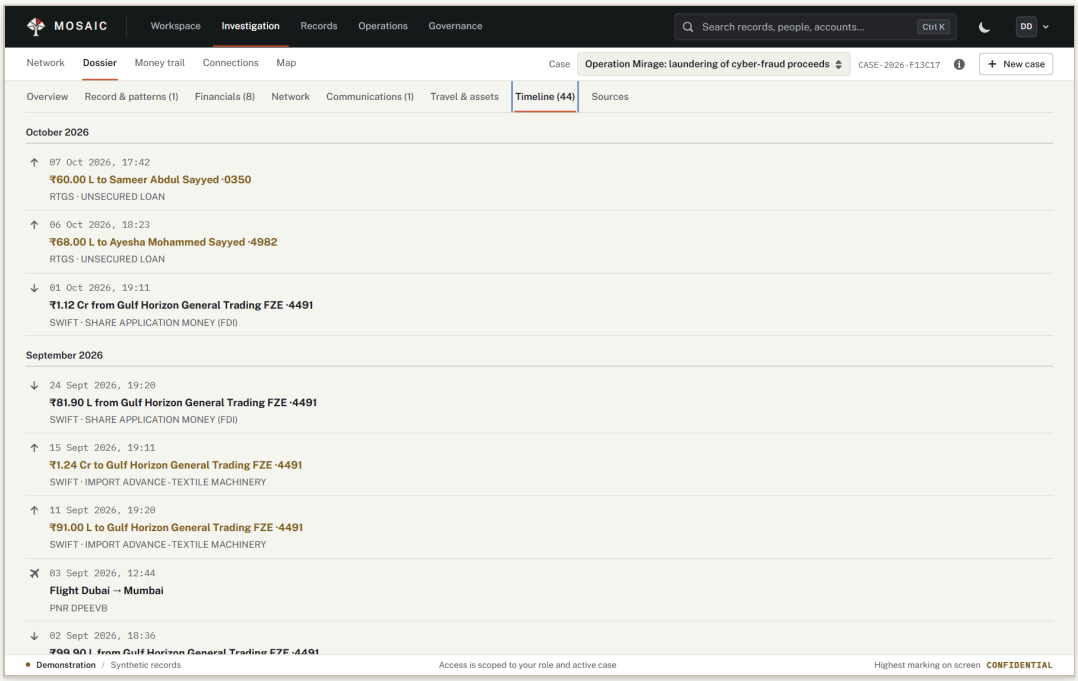

Entity dossiers contd.

Encl. 13 Financials

Money in and out is charted month by month, then every transaction is listed with its amount, channel, counterparty and any flag. Unusual movements stand out against the person's normal pattern.

Encl. 14 Timeline

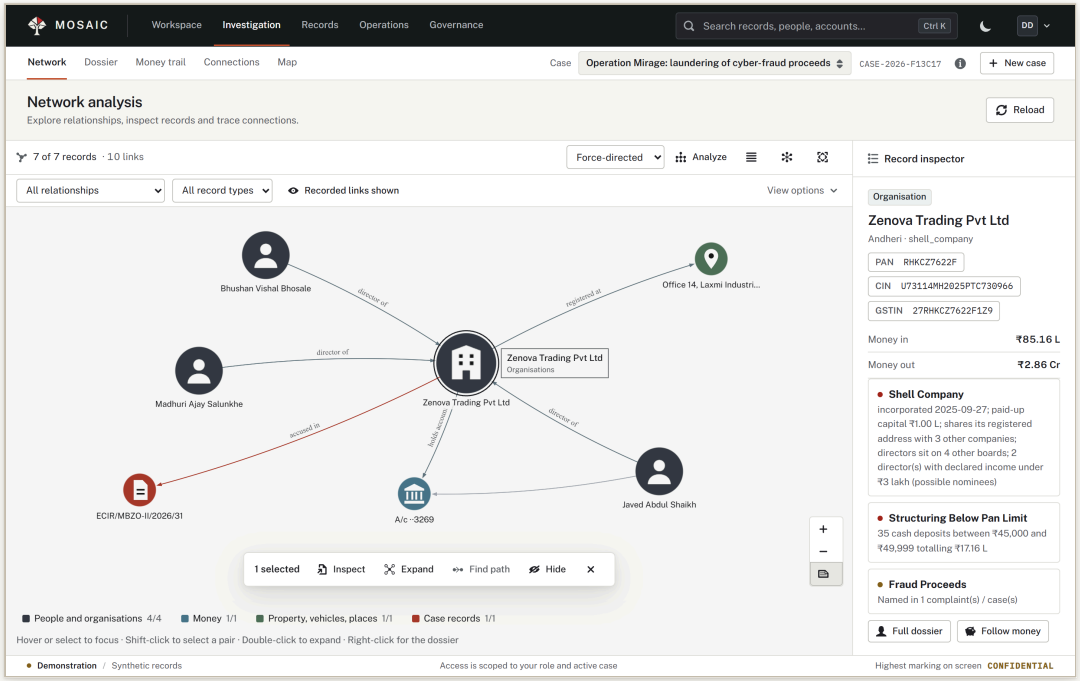

Every recorded event for the person in date order: transfers in and out with their channel and stated purpose, and journeys such as a Dubai to Mumbai flight with its booking reference. Months of activity read as one story.

Every line opens the records behind it.

Network analysis

See how people, accounts, phones and companies connect, and why, with every link opening its records.

Encl. 15 The case network

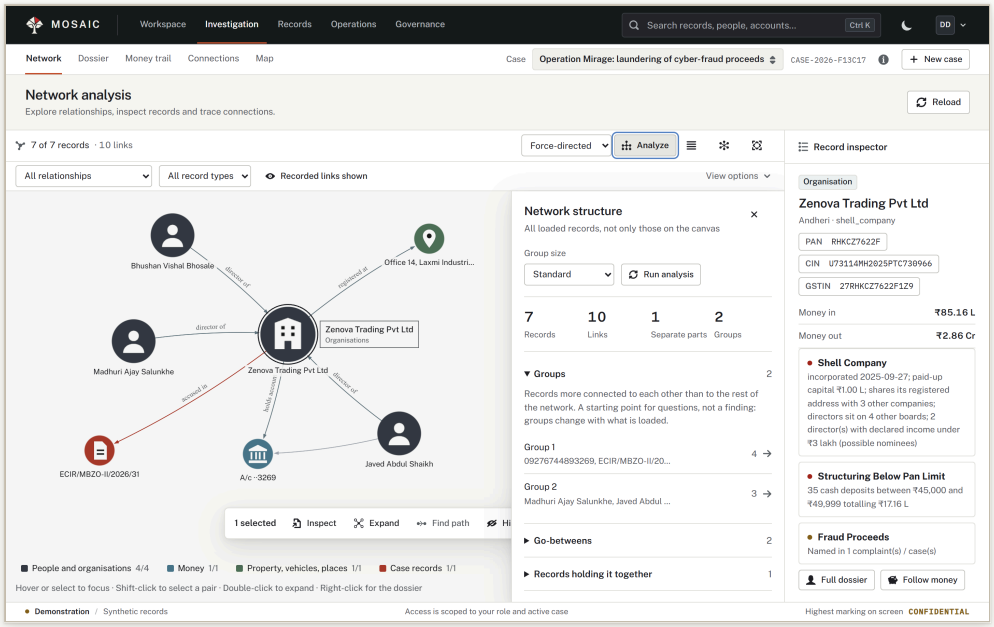

The people, companies, accounts and phones around a case, and how they connect. Selecting a record opens it in the inspector on the right, and every line opens the evidence behind it. Links suggested by the machine are drawn apart from recorded ones.

1. **Six layouts.** Structure, money flow, by type, by community, neighbourhood and free-form.
2. **Find the go-betweens.** Groups, intermediaries, weak points and loops, in one step.
3. **Paths between records.** Shortest, alternative, directed and money-only routes.
4. **Recorded or inferred.** Machine-suggested links are always drawn apart from recorded ones.

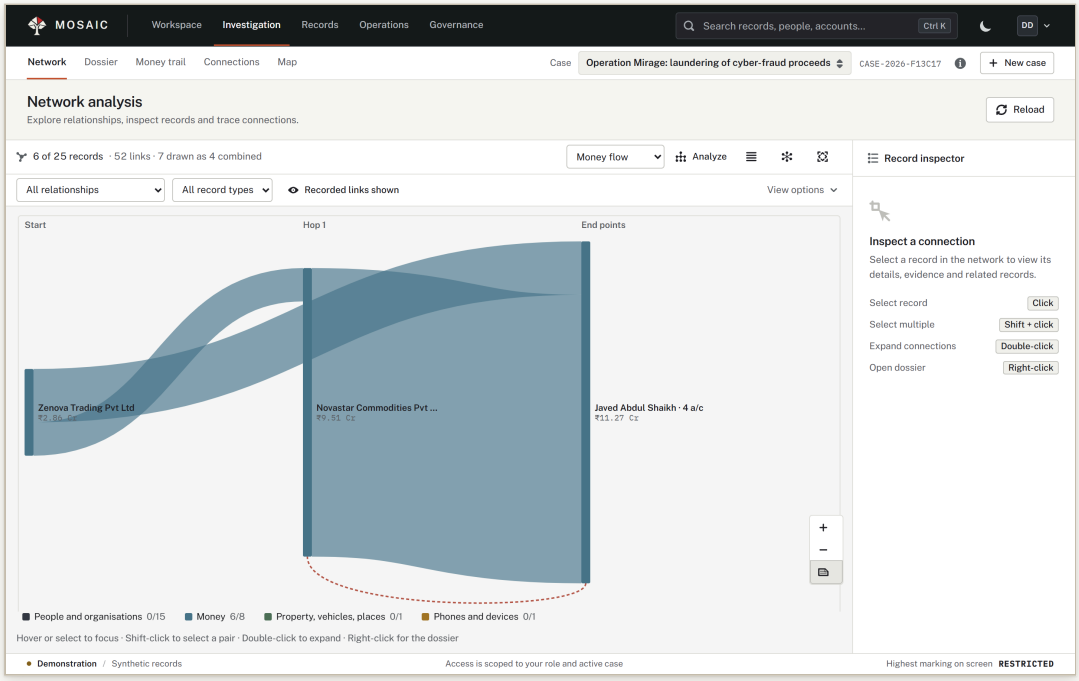

Network analysis contd.

Encl. 16 Network structure

Structure analysis finds the groups in a network, the intermediaries who connect them and the weak points where a group would split. Each result lists its members, so an analyst can explain why a person matters.

Encl. 17 Money-flow layout

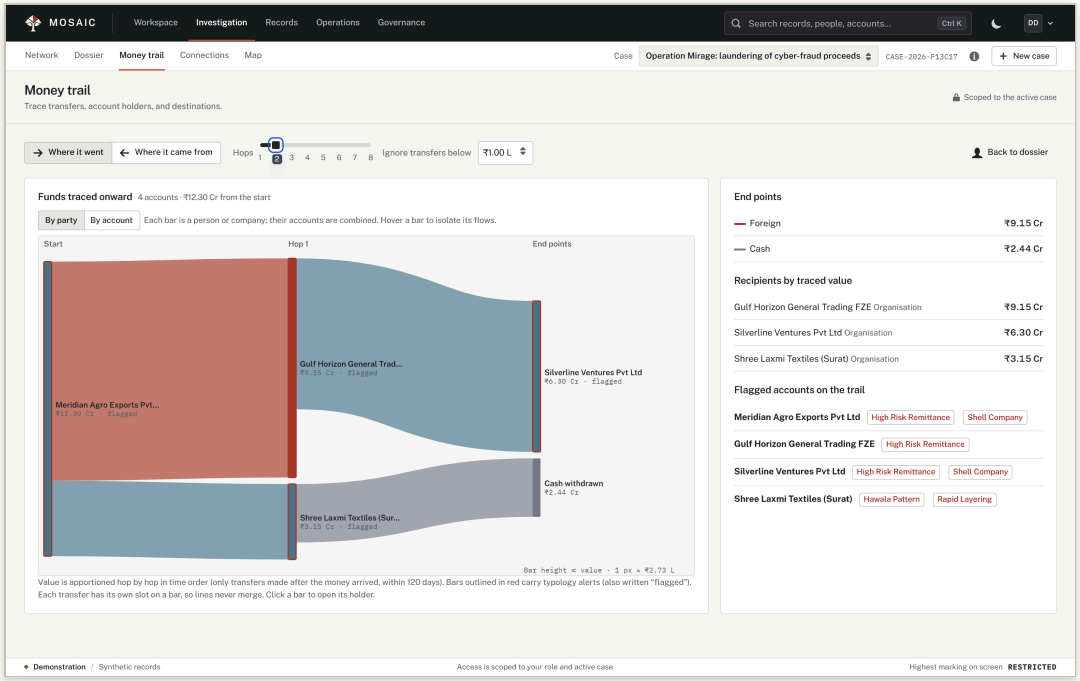

The same network redrawn as money: from the start, through each hop, to the end points, with each band as wide as the amount it carries. Here funds move from a trading company through a commodities firm to accounts held by the main suspect.

Every figure links back to its statement.

Money trail and connections

Follow funds hop by hop to their end points, and find the chain of records between any two people.

Encl. 18 The money trail

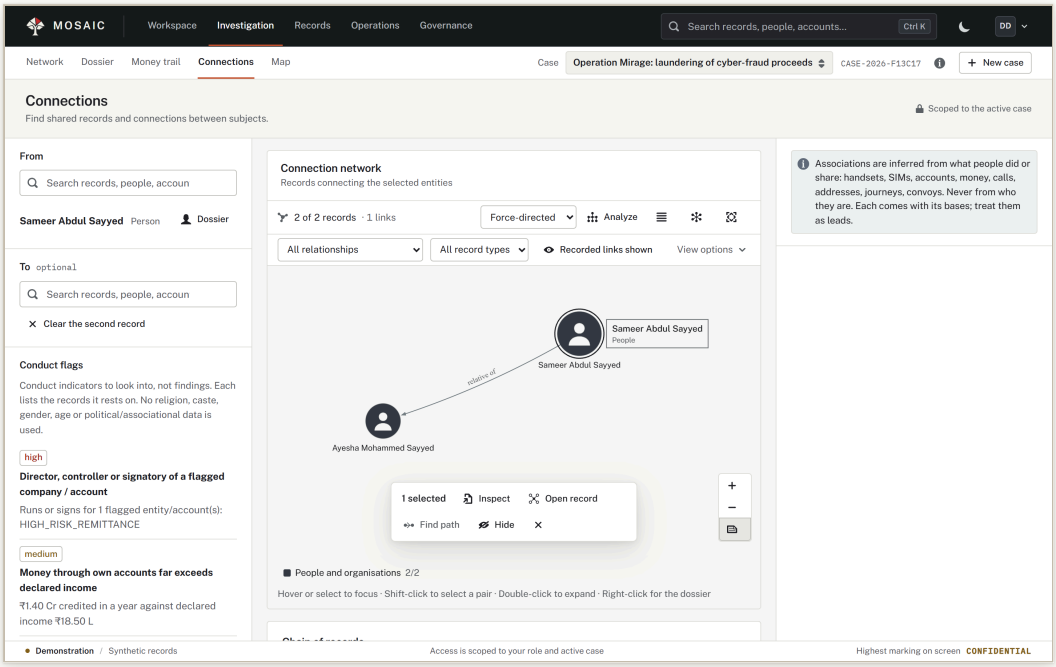

Funds are followed hop by hop from a starting point. The end points show how much ended abroad, in cash or at retail; recipients are ranked by the value traced to them, and accounts on the trail that carry alerts are flagged.

1. **Onward or back to source.** Trace where money went, or where it came from, hop by hop.
2. **By party or by account.** Combine a person's accounts, or keep each instrument apart.
3. **End points.** How much ended abroad, in cash or at retail, with ranked recipients.
4. **Connections.** The chain between two people, step by step, with its evidence.

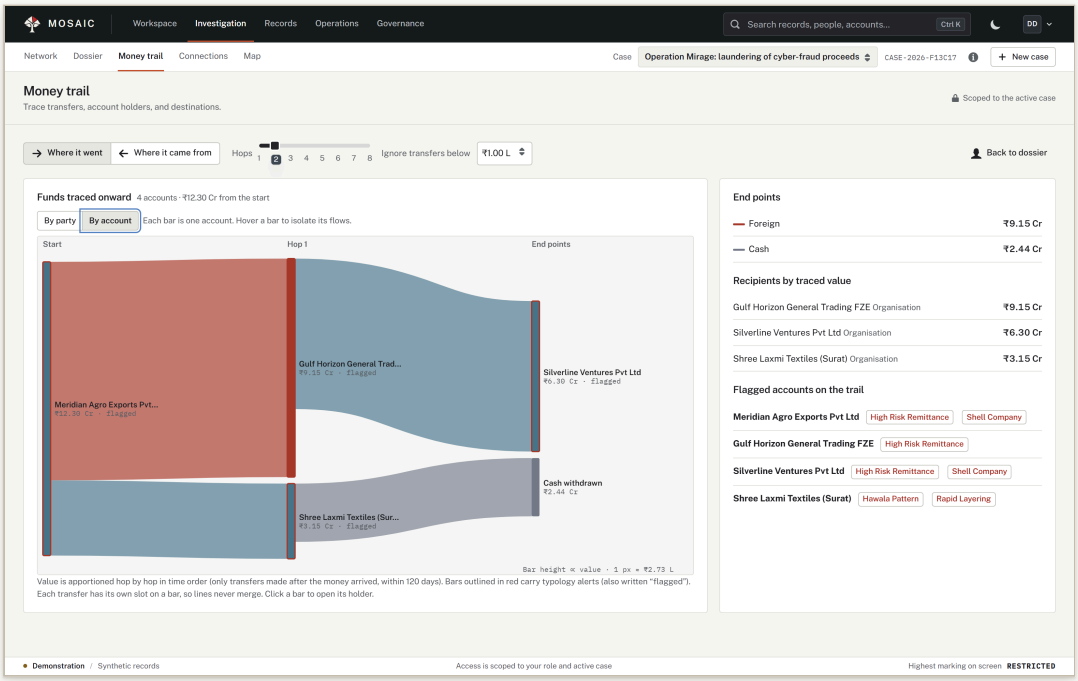

Money trail and connections contd.

Encl. 19 Connections

Connections finds the chain of records between two people, step by step: shared phones, accounts, addresses or companies. Each step names the record that links them, so the chain can be checked and cited.

Encl. 20 Tracing by account

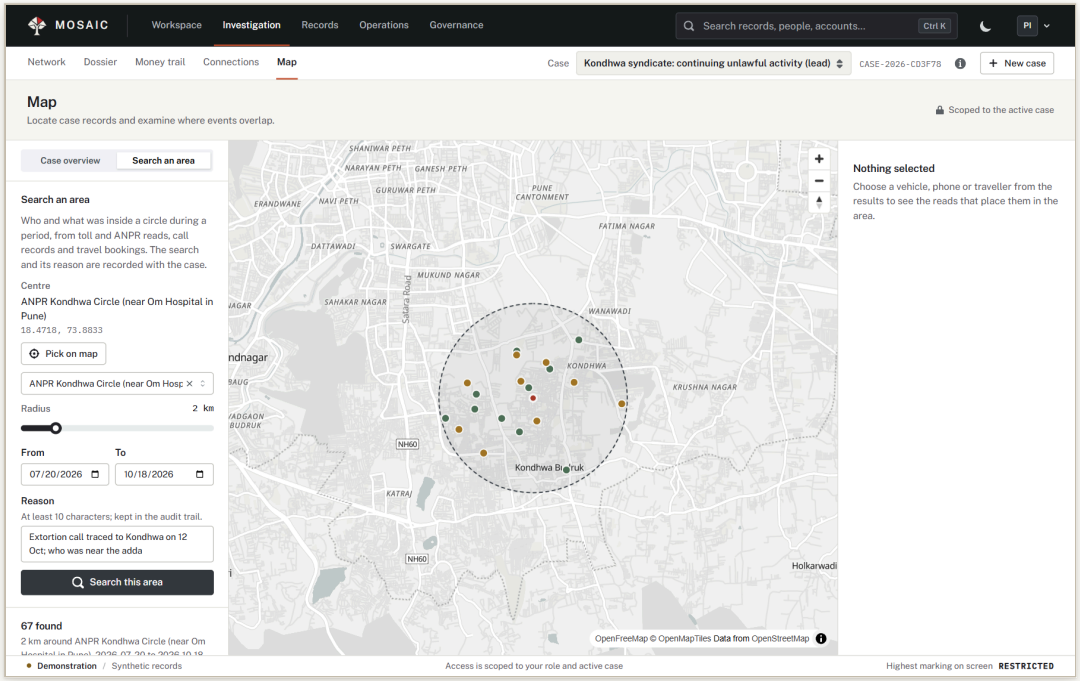

Each account is followed on its own rather than merged with its holder's other accounts. Here ₹12.30 crore from four accounts is traced to its end points, with every flagged account and its typology listed.

Who was there, and when.

Map and area search

Place the case on the map, and answer the question every investigator asks: who was there?

Encl. 21 Area search

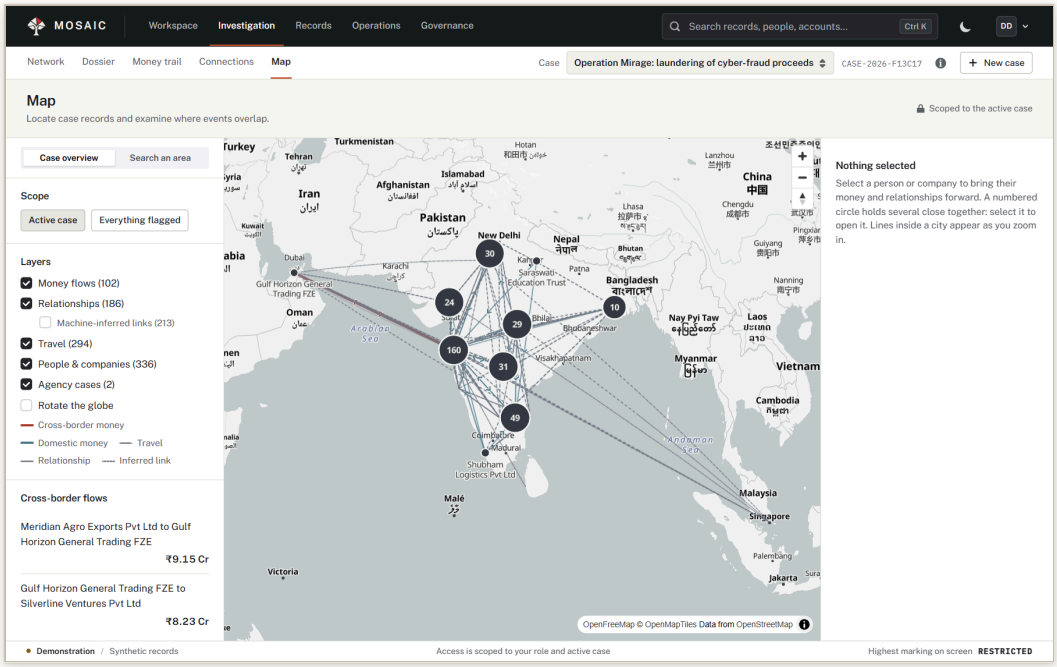

A circle and a period around a toll plaza, camera, tower or any point, and the list of who was inside: vehicles from toll and ANPR reads, phones and travellers. People already named in FIRs are listed first.

1. **The case on a map.** People, companies, money flows, relationships and travel.
2. **Search any area.** A radius and a period around a toll plaza, camera, tower or point.
3. **Who was inside.** Vehicles, phones and travellers, with people in FIRs first.
4. **Keep watching.** An area search becomes a watch that reports new presence.

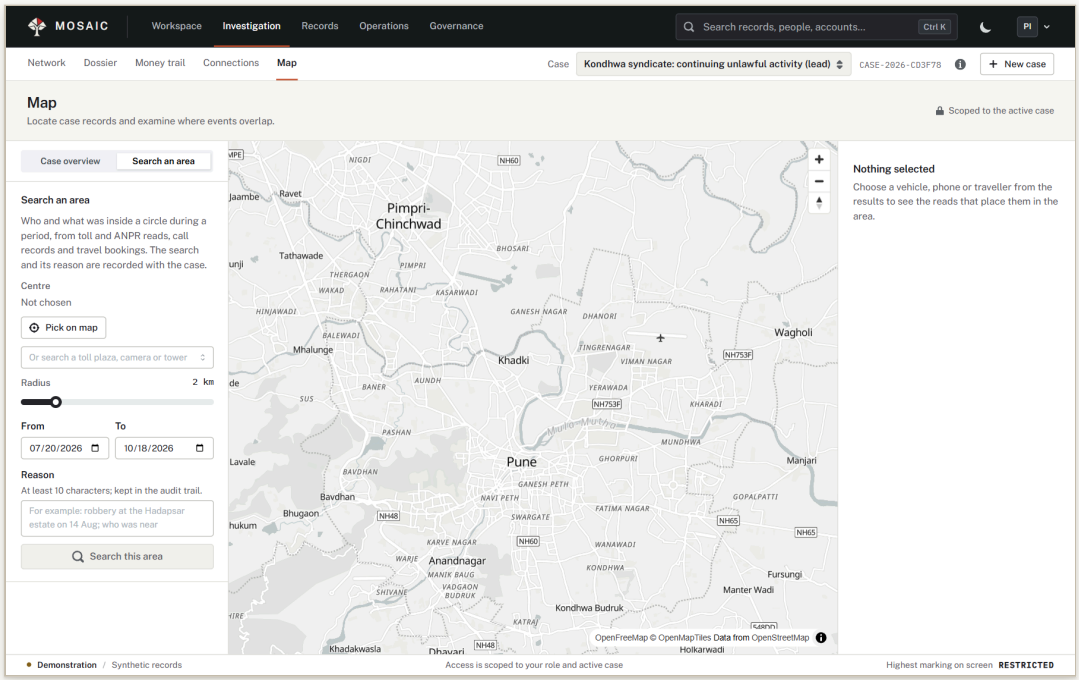

Map and area search contd.

Encl. 22 Across borders

The case map can show money and relationships beyond India. Lines show flows between India and other countries, with counts on each cluster, so the foreign links of a case are visible at a glance.

Encl. 23 Setting an area search

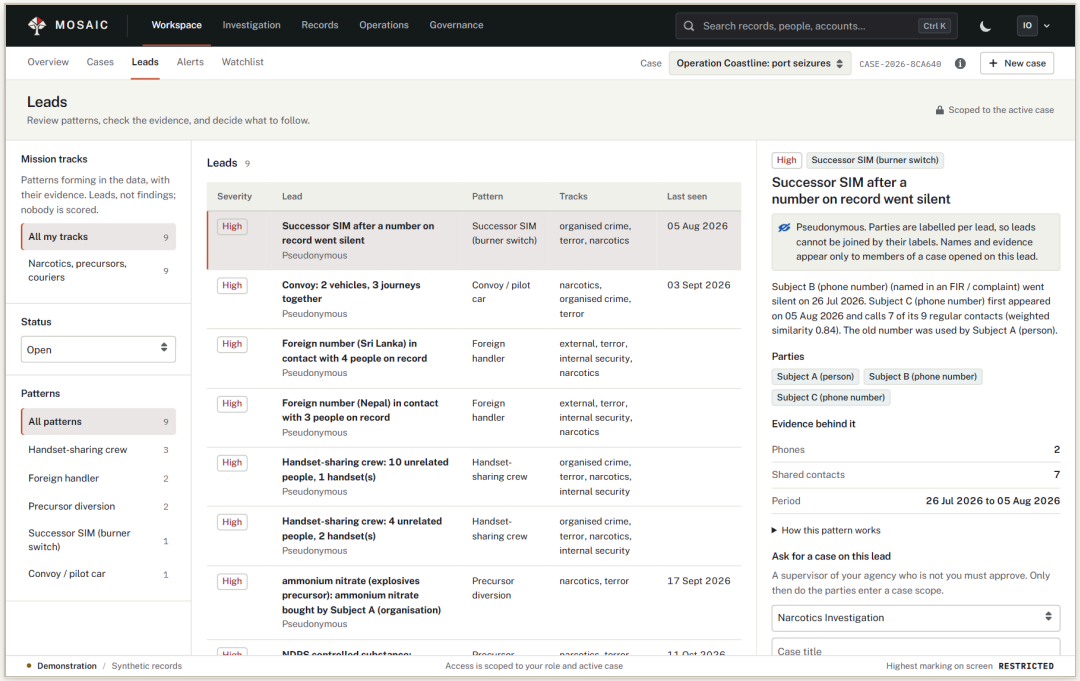

Before a search runs, the officer sets the centre, the radius and the period, and writes the reason. The search will not run without a reason, and the reason is kept in the audit trail.

Each lead arrives with its evidence.

Pattern leads and alerts

Nineteen detectors and sixteen laundering typologies watch the records and explain every finding.

Encl. 24 **Pattern leads**

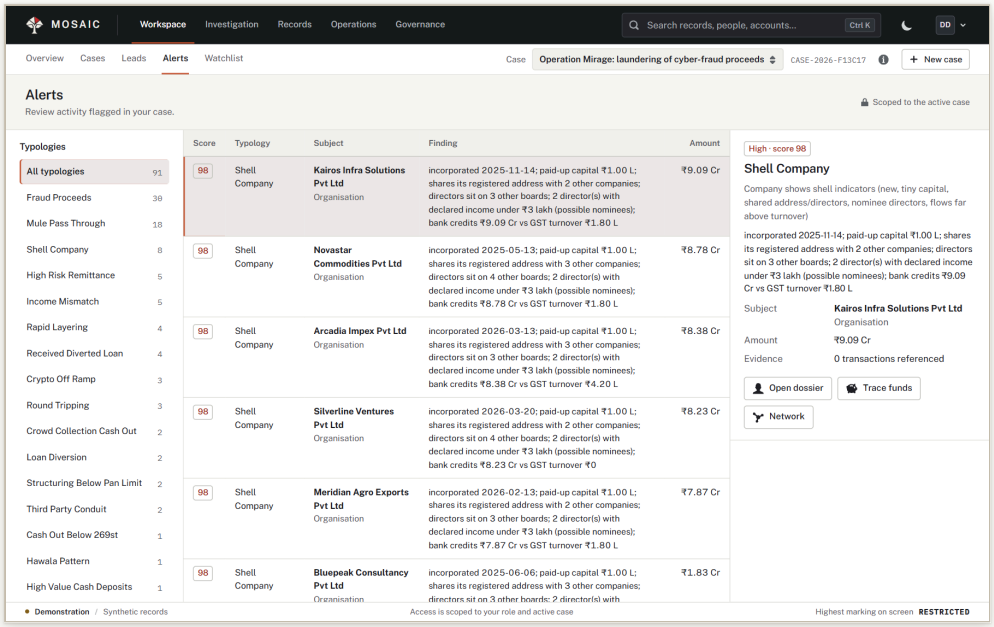

Leads for the Narcotics Control Bureau, filtered to its mission tracks. Each lead names its pattern, such as a successor SIM, a convoy or a precursor purchase, with its severity and when it was last seen. People appear only as Subject A or B until a case is opened.

1. **19 pattern detectors.** Burner SIMs, convoys, hawala points, handset sharing, precursor diversion and more.
2. **Pseudonymous leads.** Names stay hidden until two officers of the agency open a case.
3. **16 laundering typologies.** Shell companies, round-tripping, mule accounts and cash structuring.
4. **Evidence with every alert.** The exact accounts, amounts, dates and path, in plain words.

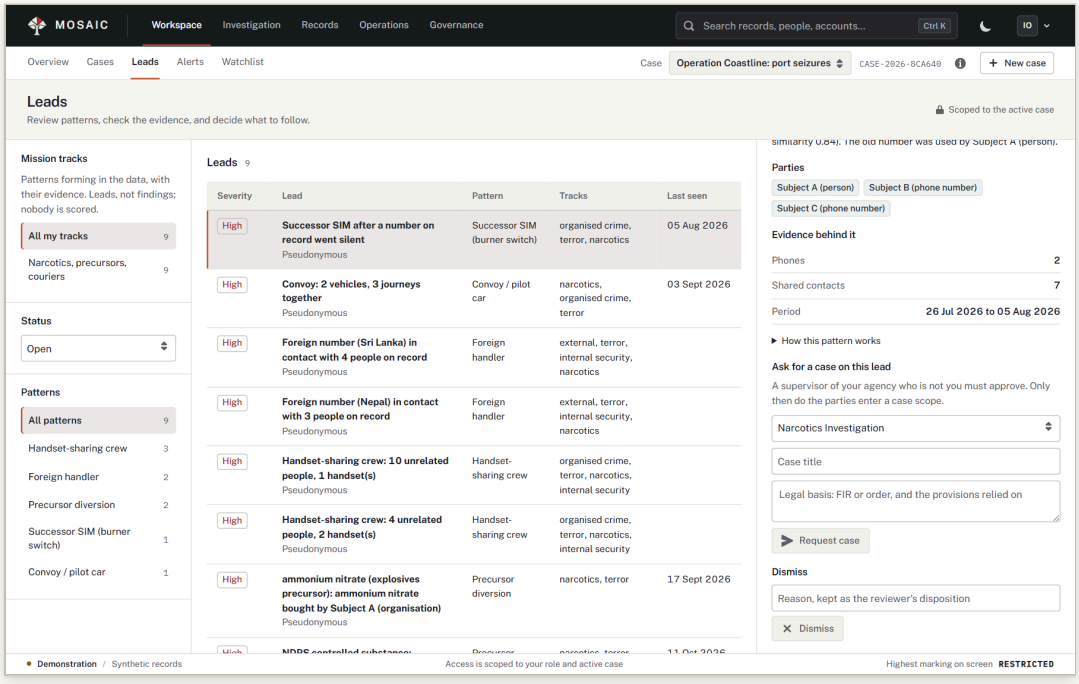

Pattern leads and alerts contd.

Encl. 25 Financial alerts

Each money-laundering typology found in the records, such as shell companies or rapid layering, is listed with its subject, amount and the finding in plain words. Selecting an alert shows the money path behind it.

Encl. 26 Asking for a case

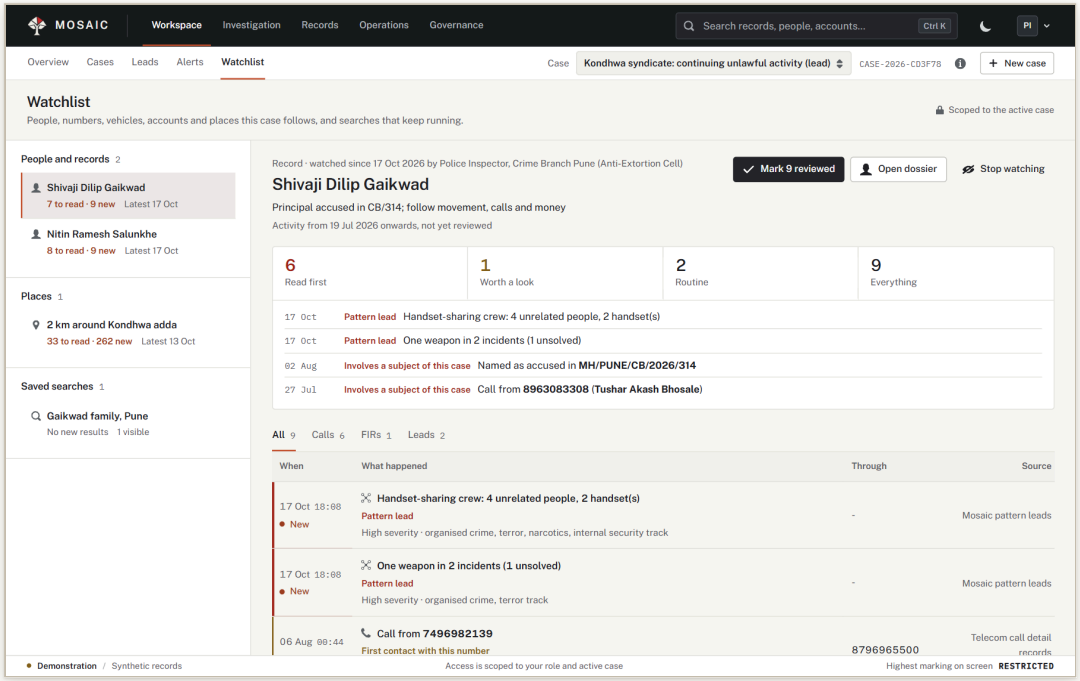

To act on a lead, the officer asks for a case: the type of investigation, a title and the legal basis. A supervisor of the same agency who is not the requester must approve before any names are shown. A lead can also be dismissed, with the reason kept.

Every watch starts and ends with a reason.

Watchlist and explorer

Follow people, numbers and places, and keep useful searches running for the case.

Encl. 27 **The watchlist**

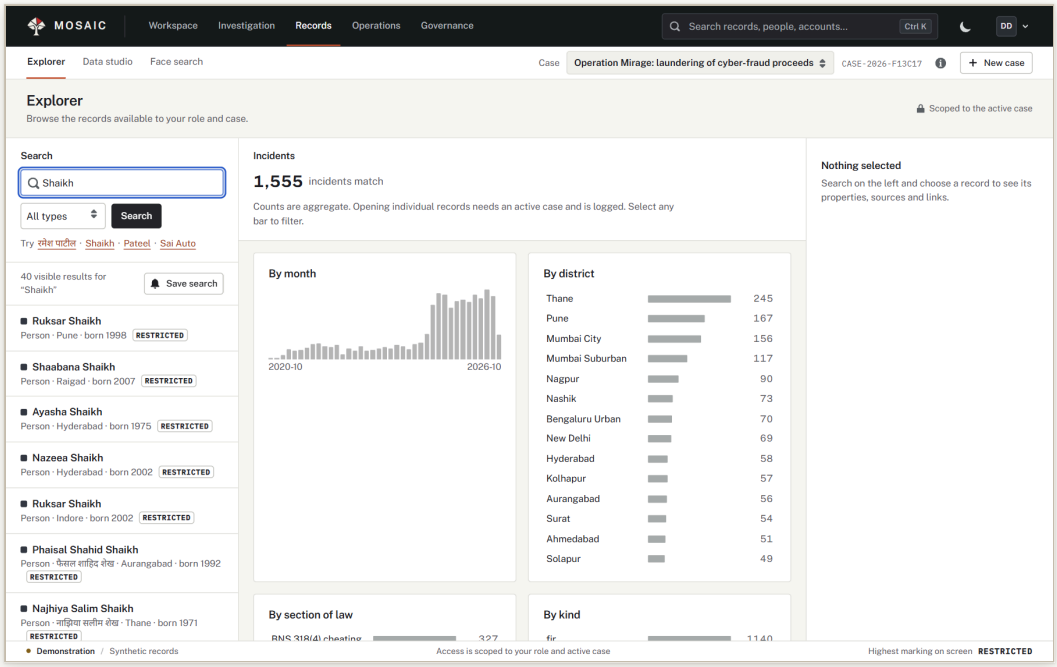

Each person, place and saved search the case is following, with its updates ranked as read first, worth a look or routine. Every update says what happened and which record it came from.

1. **Watch anything.** People, phones, vehicles, accounts and places, each with a reason.
2. **Read what matters first.** Updates ranked: read first, worth a look and routine.
3. **Searches that keep running.** Saved searches report new results to the work queue.
4. **Explore all records.** Every record type, with crime trends by month and district.

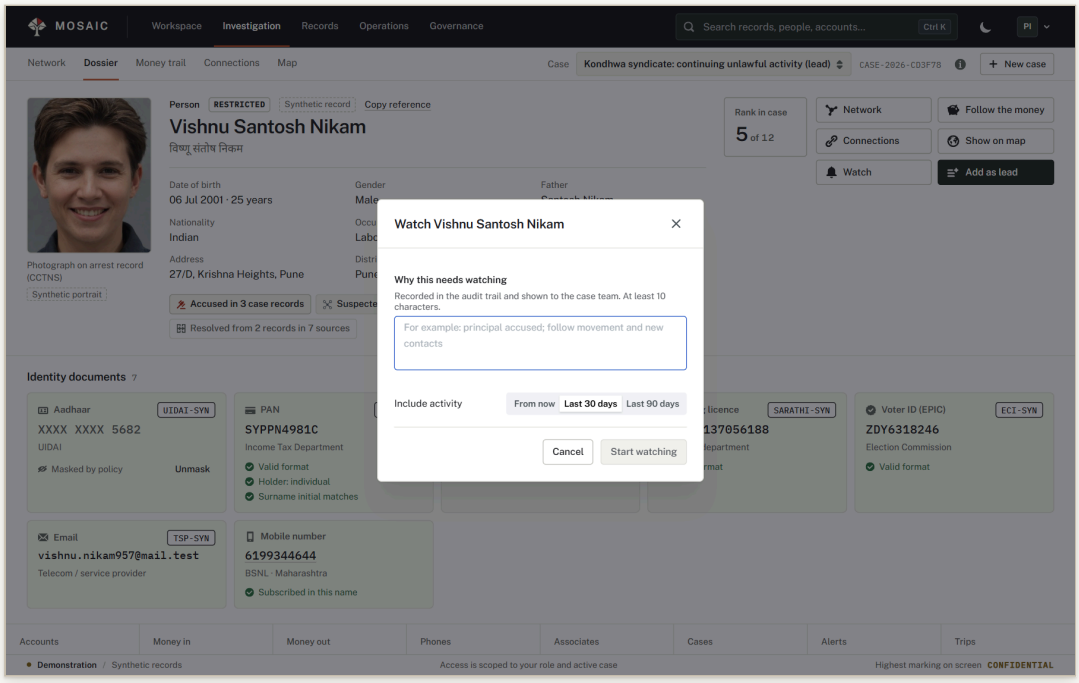

Watchlist and explorer contd.

Encl. 28 The Explorer

The Explorer searches every record type in the agency's authorised data. Results come with crime trends by month and by district, so an officer can see whether an incident belongs to a wider pattern.

Encl. 29 Starting a watch

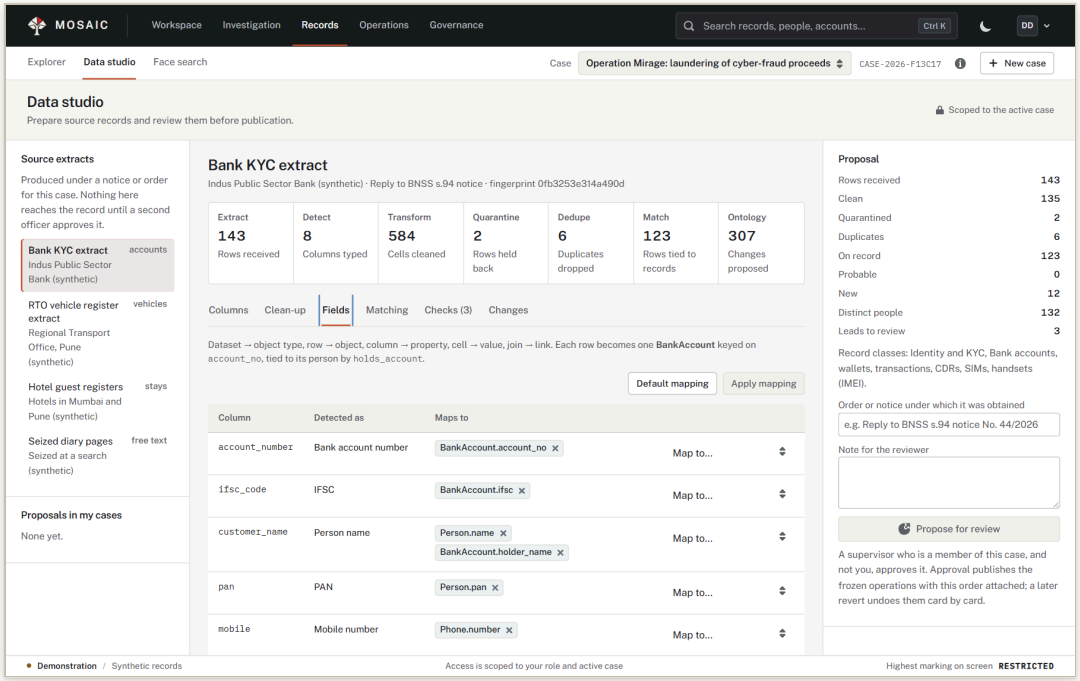

Watching a person starts from the dossier. The officer must say why the person needs watching and how far back to include activity; the reason is recorded in the audit trail and shown to the case team.

Nothing enters the record unseen.

Data studio and record matching

New records come in safely: profiled, cleaned, matched and approved by a second officer before publication.

Encl. 30 **Mapping a new source**

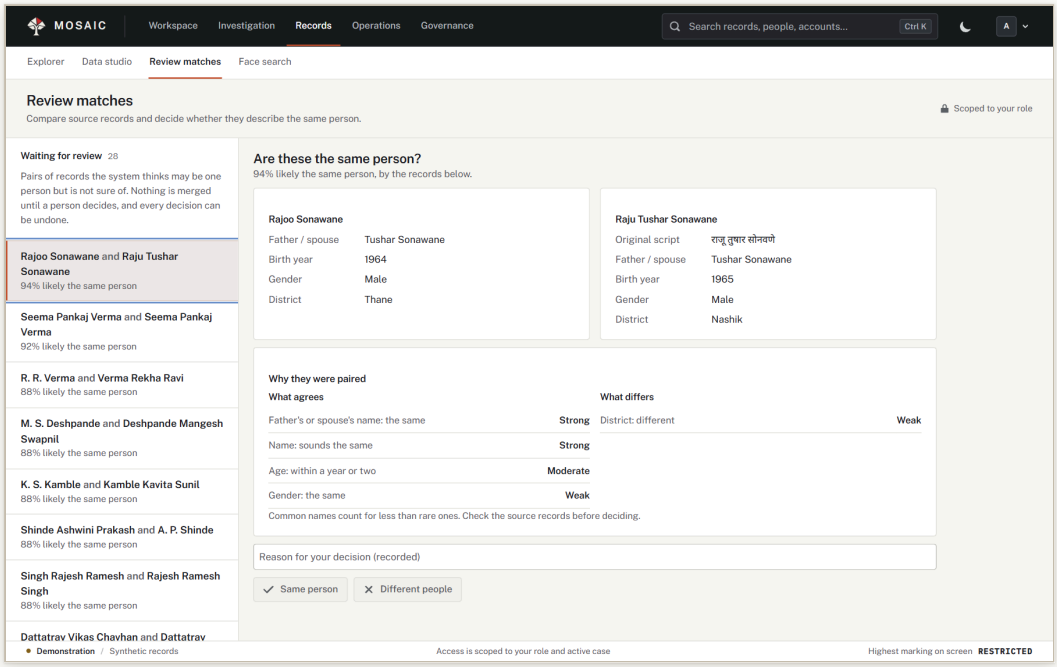

A bank's KYC extract is read column by column. Mosaic detects what each column holds and proposes the record field it maps to, and the data steward confirms every mapping before anything is proposed for publication.

1. **Profile and clean.** Every column read from its values, cleaned in visible steps.
2. **Map and match.** Columns mapped to records; rows matched to people already known.
3. **Second-officer approval.** A different supervisor approves every publication.
4. **Human match review.** Doubtful identities decided by a person, side by side.

APPROVED
SECOND OFFICER

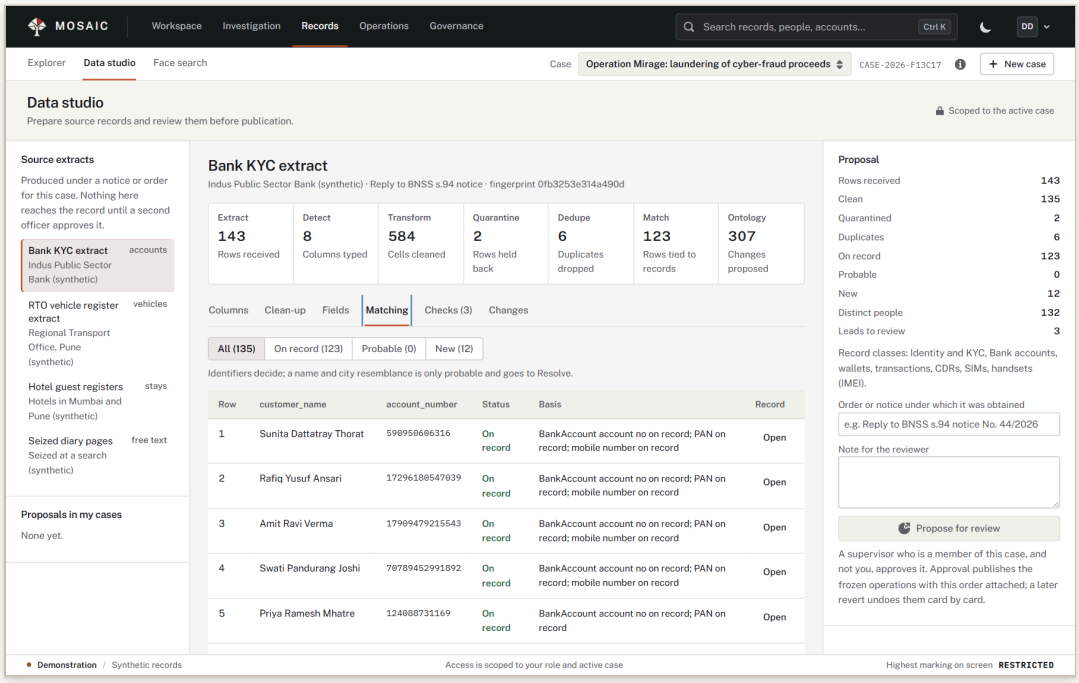

Data studio and record matching contd.

Encl. 31 Match review

Two records that may describe the same person are set side by side, in their original scripts, with what agrees and what differs. A person decides, and the decision and its reason are recorded. Nothing is merged automatically.

Encl. 32 Matching to existing records

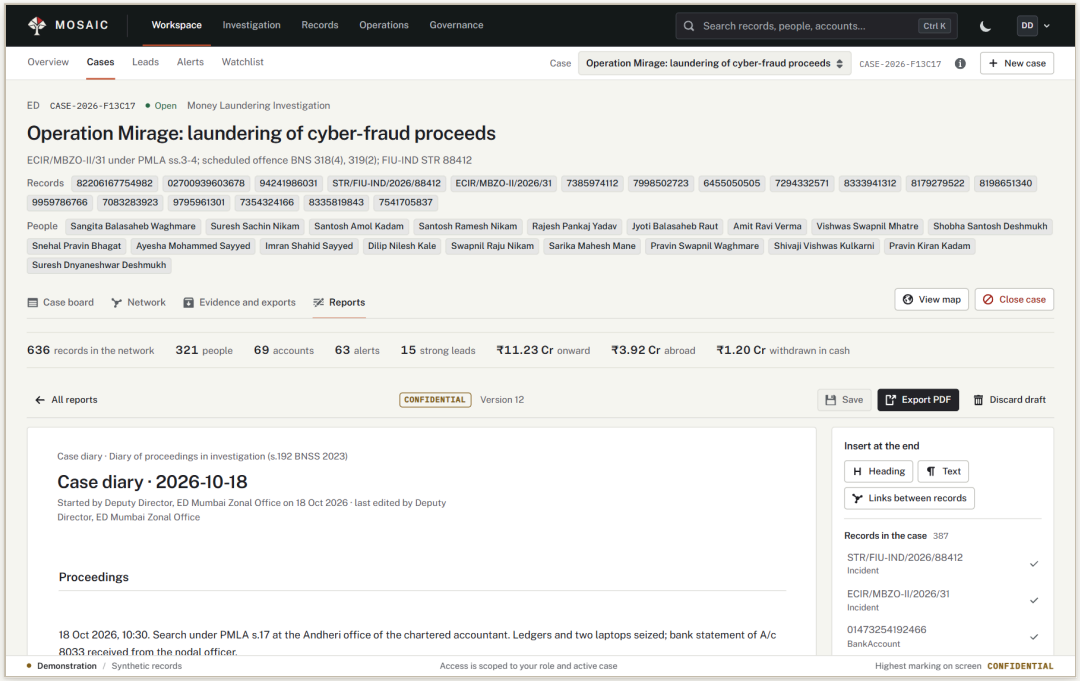

Each incoming row is tied to people and accounts already on record, with the basis shown, such as the same account number and PAN. Here 123 of 143 rows matched existing records; new and doubtful rows go to review.

Fit for the court from the first upload.

Evidence and court-ready reports

Evidence is sealed on arrival and keeps its custody chain; reports are written from the facts and always match them.

Encl. 33 Writing the case diary

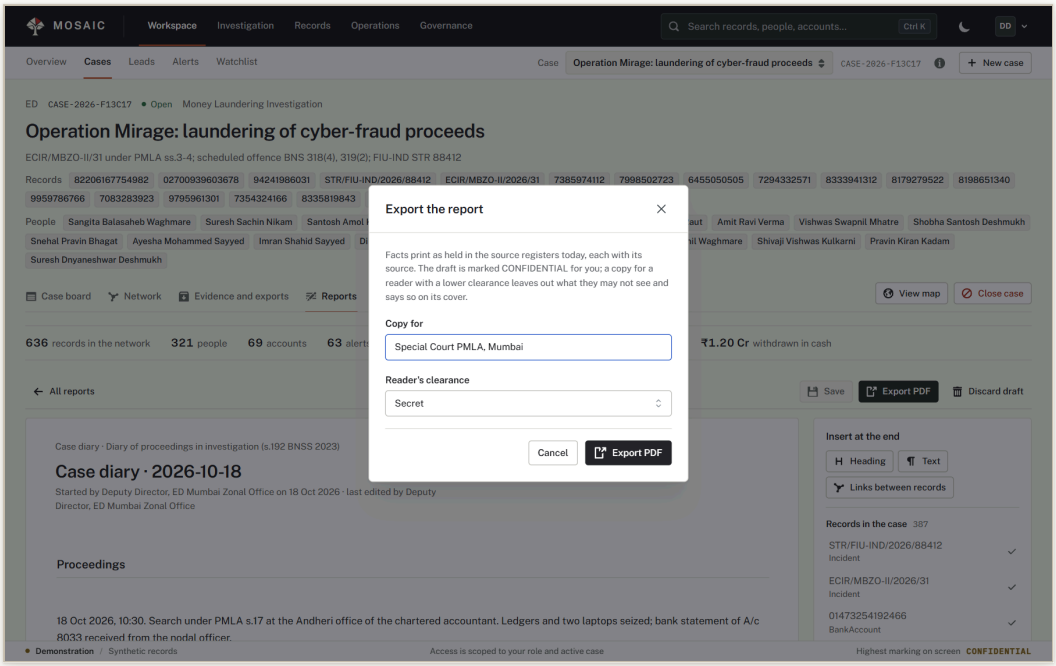

Reports are written inside the case. The case diary inserts facts straight from the records, each carrying its source, so the report always matches the evidence.

1. **Sealed on arrival.** SHA-256 fingerprint, write-once storage and device details.
2. **Custody chain.** Every view, download and verification recorded automatically.
3. **Reports from the facts.** Case diary, charge-sheet annexure and intelligence summary.
4. **Court evidence pack.** Exhibits, custody, manifest and a draft BSA s.63(4) certificate.

SEALED
SHA-256

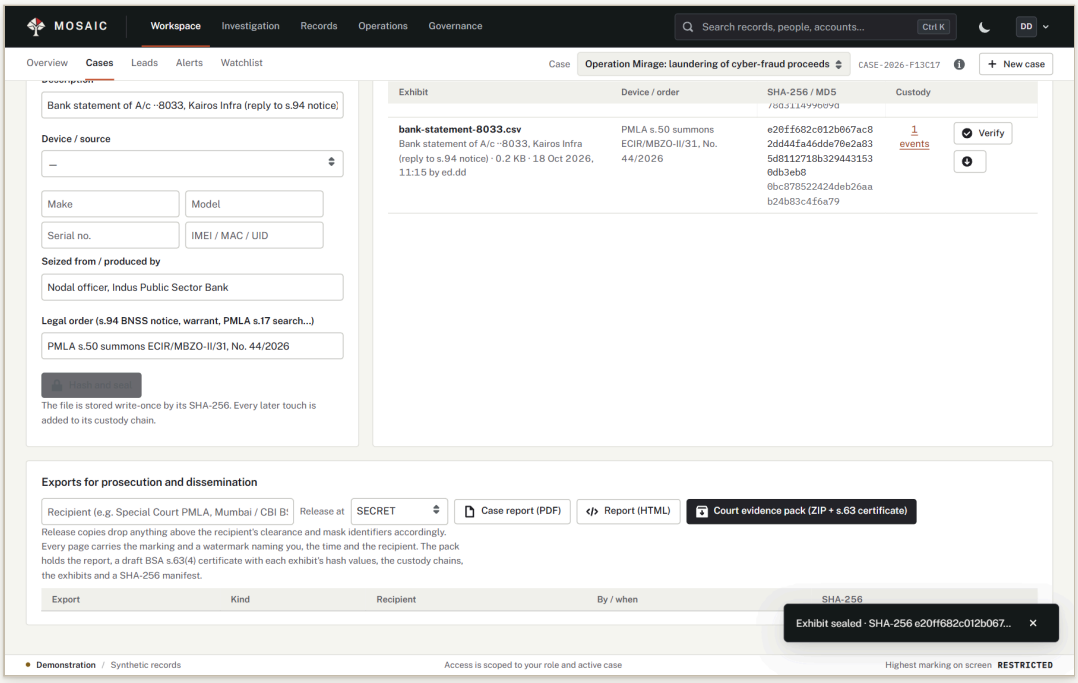

Evidence and court-ready reports contd.

Encl. 34 Exporting a report

An export asks who the copy is for and at what clearance. Facts above the reader's clearance are left out, and the copy carries its marking and a watermark naming the recipient.

Encl. 35 The evidence locker

Each exhibit is recorded with its device, the legal order it was seized under and its SHA-256 fingerprint. Every view, download and verification is added to its custody chain, and exports for prosecution are made from here.

Evidence and court-ready reports contd.

Encl. 36 Draft BSA s.63(4)(c) certificate

DRAFT CERTIFICATE - TO BE VERIFIED AND SIGNED

CERTIFICATE UNDER SECTION 63(4)(c) OF THE BHARATIYA SAKSHYA ADHINIYAM, 2023

PART A (to be filled by the party)

I, Deputy Director, ED Mumbai Zonal Office, do hereby solemnly affirm and sincerely state and submit as follows:
I have produced the electronic record / output of the digital record 'cctv-still.jpg' (Face search still), taken from the following device / digital record source:

Computer / storage media
DVR
Mobile phone
Flash drive
CD / DVD
Server
Cloud
Other

Make and model _____
Serial number _____
IMEI / UIN / UID / MAC / Cloud ID _____
Seized from / custody _____
Legal order Seizure memo 12/2026: ATM camera footage, Vashi

The digital device or the digital record source was under the lawful control for regularly creating, storing or processing information for the purposes of carrying out regular activities, and during this period the computer or communication device was working properly and the relevant information was regularly fed into it during the ordinary course of business. If the computer / digital device was not working properly at any time, that did not affect the electronic / digital record or its accuracy. The digital device or the source of the electronic record is: owned maintained managed operated by me (select as applicable).
I state that the hash value(s) of the electronic / digital record(s) is/are:
SHA-256: e95ab4427919a6f57afb7fe6e1fc53496f2b8cf5a36cc4eed7141c8504b7c4a4
MD5: 39c476946314a29d6a578d311499609d
obtained through the following algorithm: SHA1 SHA256 MD5 Other (legally acceptable standard). (Hash report to be enclosed with the certificate.)

Date (DD/MM/YYYY): _____ Place: _____ Name and signature: _____

PART B (to be filled by the expert)

I, _____, son / daughter / spouse of _____, residing / employed at _____, do hereby solemnly affirm and sincerely state and submit that the produced electronic record / output of the digital record was obtained from the device described above, and that its hash value(s) is/are:
SHA-256 / MD5 (to be computed independently by the expert): _____

Date (DD/MM/YYYY): _____ Place: _____ Name, designation and signature: _____

Mosaic exhibit evidence:6364ced46bd1fa75 · uploaded 2026-10-18T05:42 by ed.dd · 3 custody events recorded. This draft was generated from the evidence locker; the signatories must verify every statement before signing.

Mosaic export 402B8464 · by ed.dd · 2026-10-18 05:45 UTC · copy for court filing DRAFT CERTIFICATE - TO BE VERIFIED AND SIGNED · page 1/2

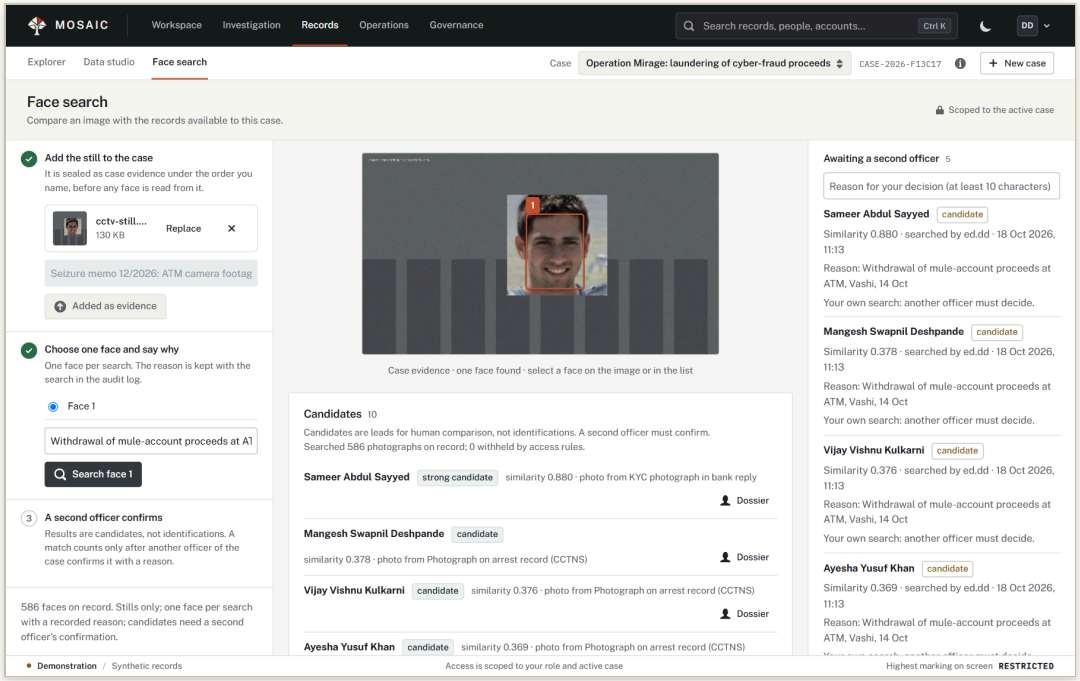

The court evidence pack includes a draft certificate under section 63(4)(c) of the Bharatiya Sakshya Adhiniyam, filled from the exhibit's details and hash values. Part A is for the party producing the record and Part B for the expert; both are verified and signed before filing.

Every comparison traces back to a sealed exhibit.

Face search

A case-bound face search: the still is sealed as evidence first, and only a second officer can confirm a match.

Encl. 37 **Face-search candidates**

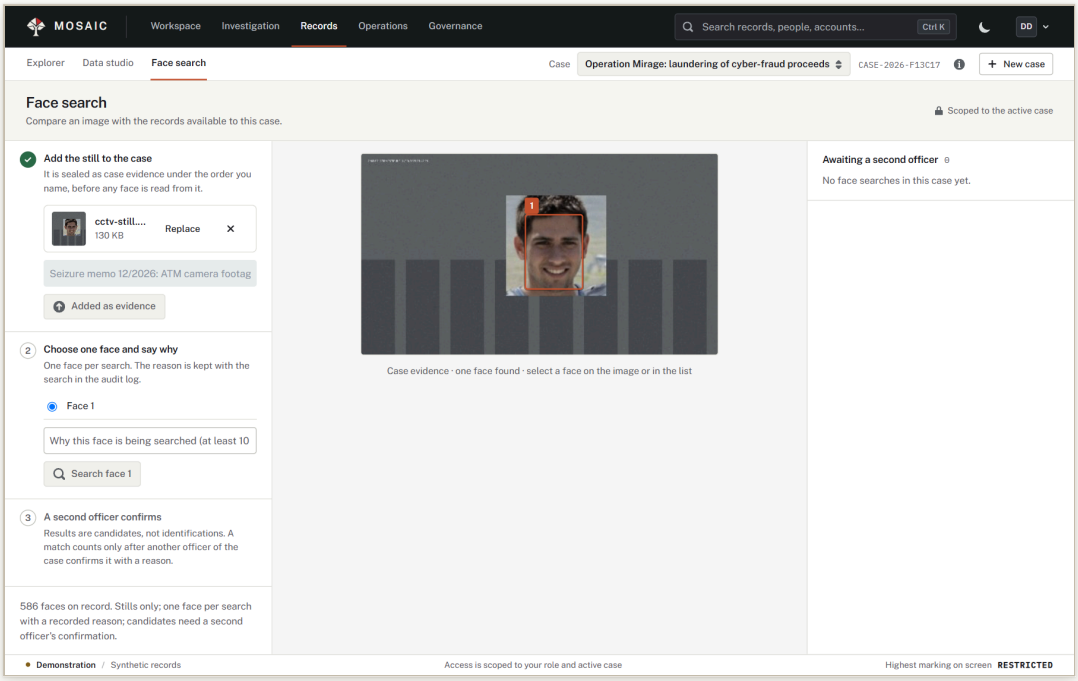

One face from a sealed still is compared with the photographs available to the case. Results are candidates, each with its similarity and the source of the photograph; a candidate is never an identification.

1. **Evidence before search.** The still is sealed under its legal order before any face is read.
2. **One face, one reason.** Each search is specific, and its reason recorded.
3. **Candidates only.** Similarity and the source of every photograph.
4. **Second-officer confirmation.** No one can confirm their own search.

CONFIRMATION
BY SECOND OFFICER

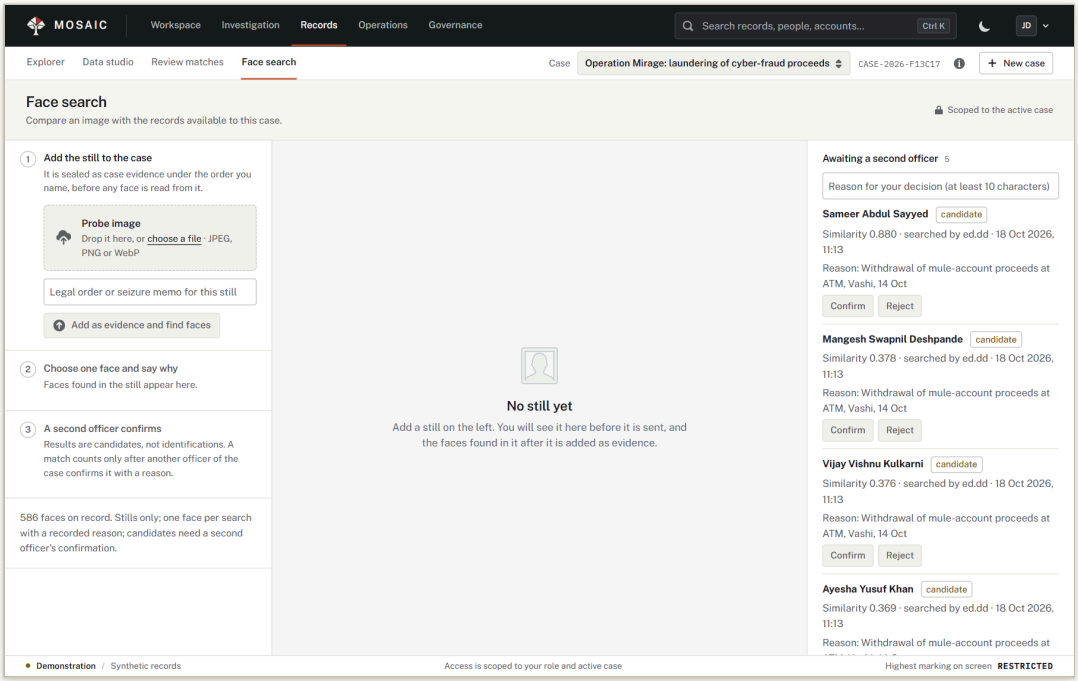

Face search contd.

Encl. 38 Choosing a face

The still is first added to the case as evidence under its legal order. Then the officer chooses one face and writes why it is being searched; the reason stays in the audit log.

Encl. 39 Second-officer confirmation

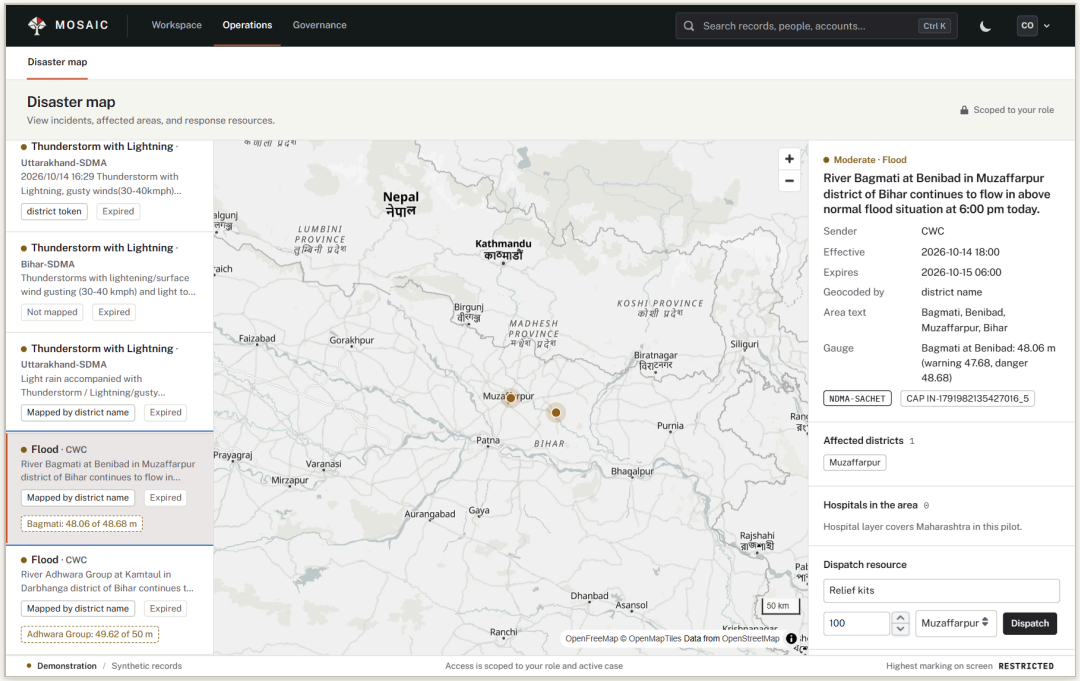

Candidates wait in a queue for a second officer, who confirms or rejects each one with a reason. No officer can confirm a match from their own search.

One picture for the whole control room.

Disaster operations

One operational picture for the state control room, from the official alert to the dispatch log.

Encl. 40 A flood alert

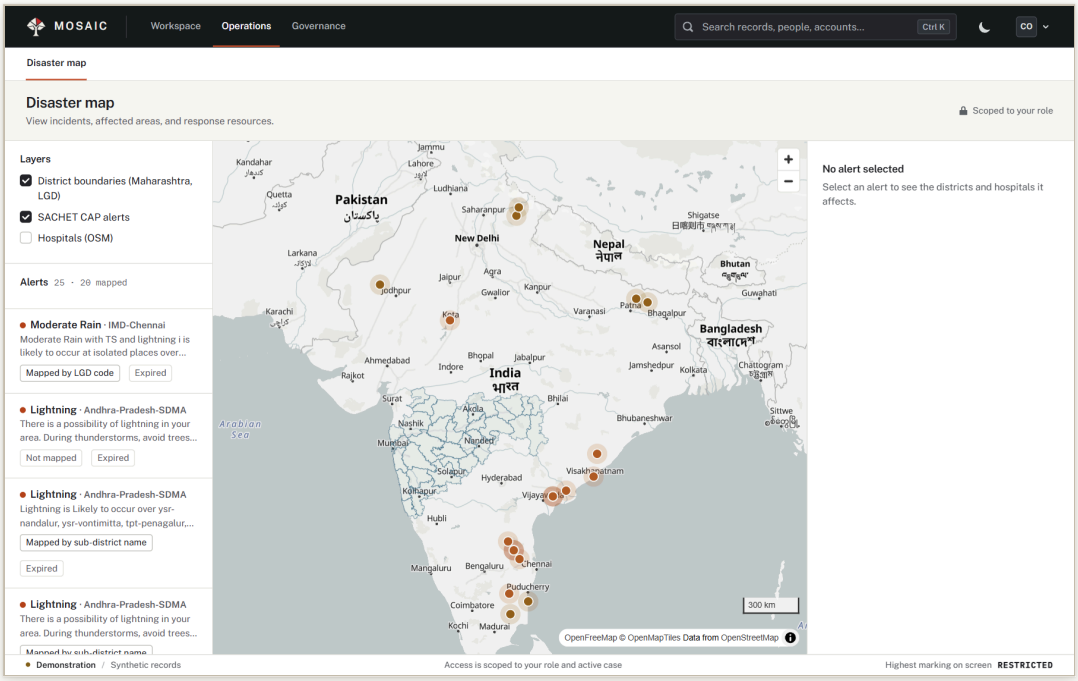

An official CWC flood alert for the Bagmati at Benibad, with its sender, validity and affected district, the river level against its warning and danger marks, and the hospitals in the area.

1. **Official alerts.** NDMA SACHET alerts with sender, severity and validity.
2. **Mapped precisely.** By district code, polygon, place name or river gauge.
3. **Flood context.** River levels against warning and danger marks.
4. **Dispatch log.** Resources, quantities and destinations, visible to the whole room.

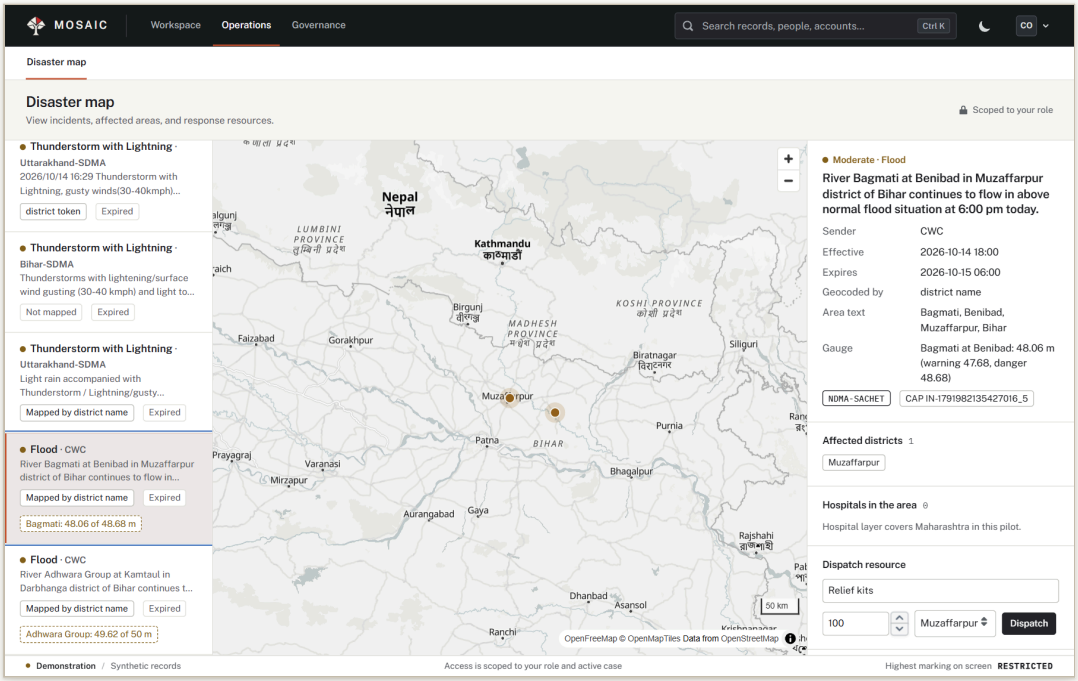

Disaster operations contd.

Encl. 41 Alerts across India

SACHET alerts from IMD, CWC and state authorities are placed on the map by official district code, polygon or place name, so the control room sees every active warning at once.

Encl. 42 Dispatching relief

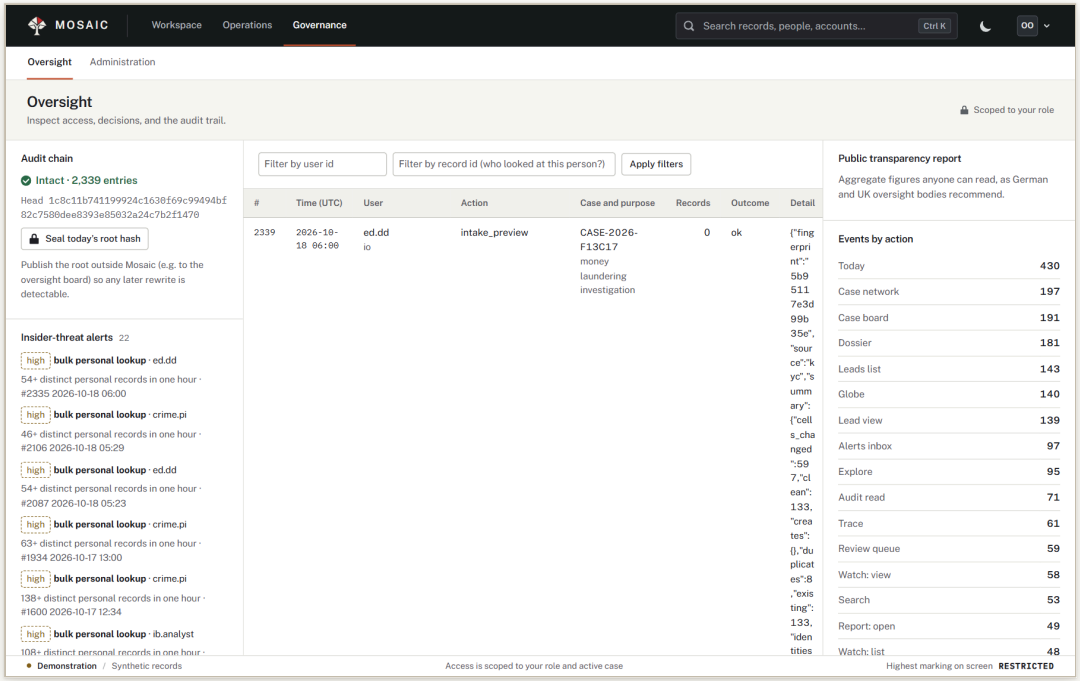

From an alert, the control room sends relief: the resource, the quantity and the destination district. Each dispatch is logged and visible to the whole room.

Every access is visible to oversight.

Oversight and administration

Independent oversight of who saw what and why, and an open record of how every detector works.

Encl. 43 **The oversight console**

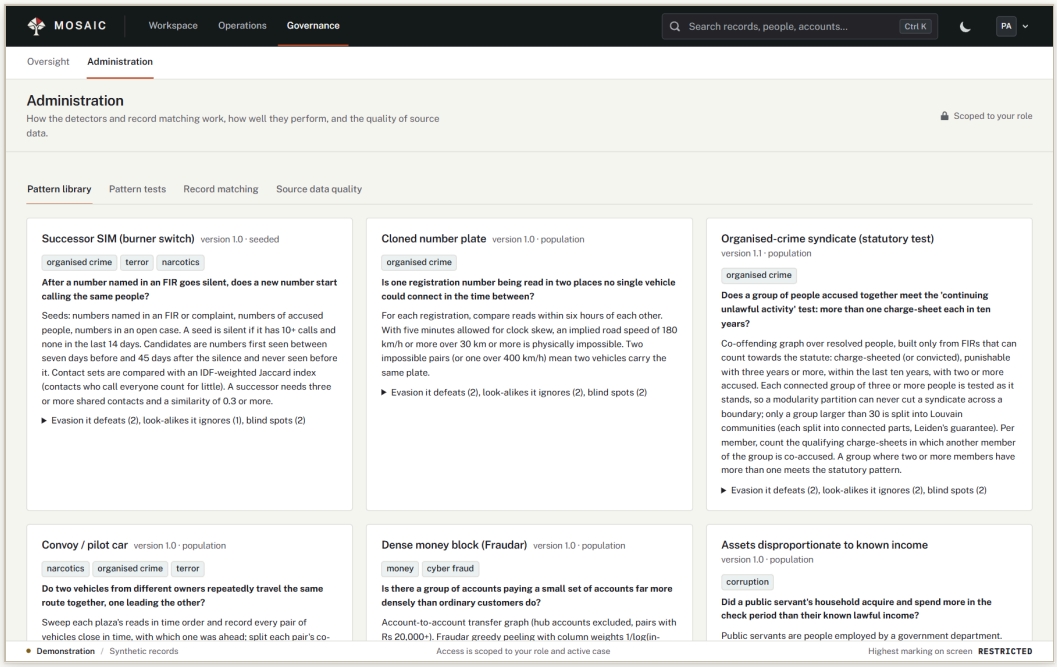

An independent officer sees every access by officer, case, purpose and outcome, checks the hash-chained audit log and reviews insider-threat alerts such as bulk look-ups, without seeing case data.

1. **Who looked, and why.** Every access by officer, case, purpose and outcome.
2. **Tamper-evident chain.** A hash-chained log, with the daily root hash sealed.
3. **Insider-threat alerts.** Bulk look-ups and canary records flagged for review.
4. **Documented detectors.** Each detector's question, method, inputs and limits.

AUDITED
HASH-CHAINED

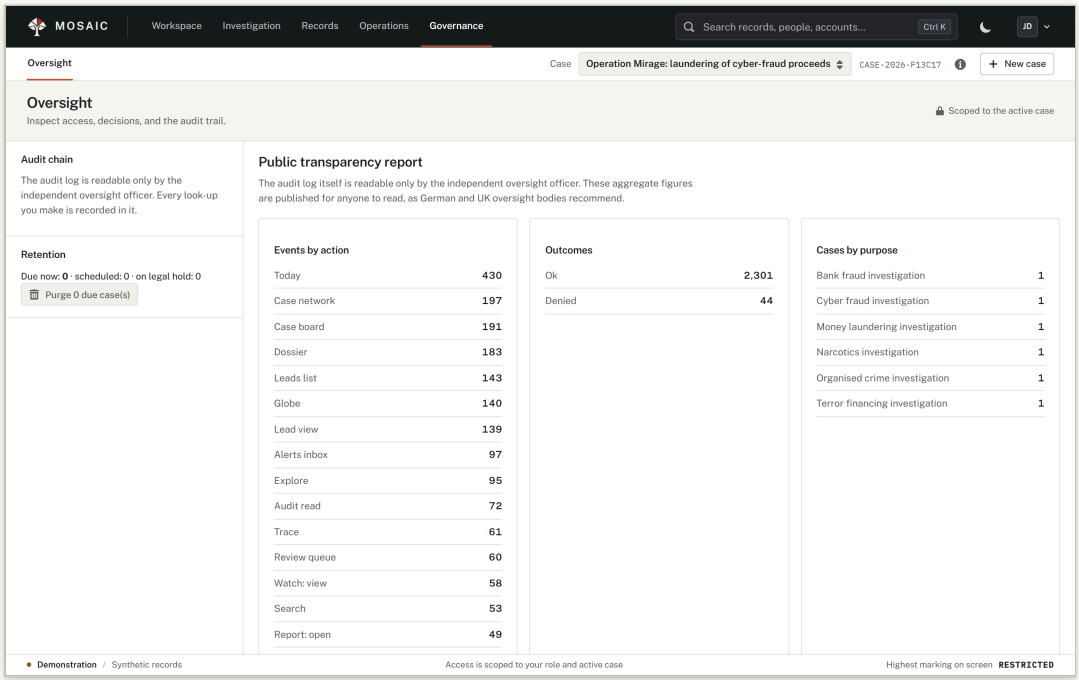

Oversight and administration contd.

Encl. 44 The pattern library

Each pattern detector is documented: the question it asks, how it works, the records it uses and its limits, so anyone reviewing a lead can see exactly why it was raised.

Encl. 45 The transparency report

Aggregate figures published for anyone to read: actions by type, outcomes allowed and denied, and cases by purpose. The audit log itself stays readable only by the oversight officer.

Flag G

Technology

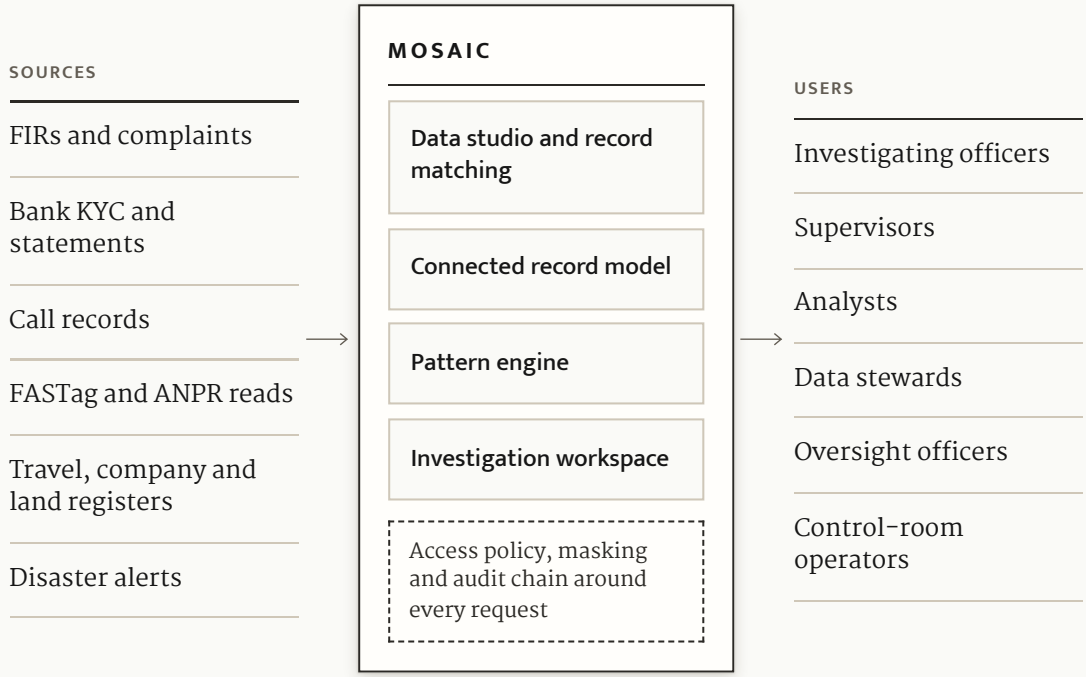

What is it built on, and where does it run?

Open, standards-based and ready for government infrastructure 47

The same safeguards travel with the software.

Open, standards-based and ready for government infrastructure.

From a single offline laptop at a police station to a state data centre serving thousands of officers.

1. **Open technology.** A React and TypeScript web application on a Python FastAPI service, open source under Apache 2.0.
2. **Your choice of database.** SQLite for offline field use; PostgreSQL for state-scale deployments.
3. **Government sign-in.** OpenID Connect with Keycloak and authenticator-app login; every access decision can be checked by Open Policy Agent.
4. **Indian geography.** Official LGD codes for every state and district, and the Survey of India or Bhuvan basemap in deployment.

End of file. A demonstration request follows.

Request a demonstration

See Mosaic at work on your agency's questions, with your own officers at the controls.

Weirwood is an Indian technology company. It builds investigation and intelligence software for the institutions that protect India.

Mosaic, its platform, connects an agency's authorised records into one accountable picture, from the first search to the court-ready report.

All records shown in this brochure are synthetic, created for demonstration.
